PRESENTING CLINICAL SIGNS

Gave barium last night, via rads was now in colon. Clinically improved. No V/D

Abnormal PE/Chem/CBC/UA Results: 4/29/26 ULTRASONOGRAPHIC FINDINGS: Over distended stomach with shadowing material. Partial obstructive intestinal pattern, exact cause is unclear.

LIMITED ULTRASONOGRAPHIC EXAMINATION

Gastrointestinal

The **stomach** presented with persistent progressively shadowing luminal material. The small intestine and colon were empty. Minor transit of chyme appeared to be occurring in portions of the small intestine. The upper small intestine was mildly dilated followed by empty small intestine. An image at 801.43 AM revealed a 2.6 cm shadowing structure consistent with jejunal foreign body.

ULTRASONOGRAPHIC FINDINGS

- Jejunal foreign body obstruction with obstructive upper GI pattern delayed outflow.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Even though barium has passed into the colon on barium study, fluid is likely passing through this foreign matter yet cannot rule out the potential of the structure moving further through into the ileocecal junction. However, at the time of the sonogram, was persistently obstructive. Recommend imaging just prior to surgery to ensure the obstructive pattern is still present with dilated upper gastrointestinal tract and stomach followed by empty small intestine.
