PRESENTING CLINICAL SIGNS

History: Patient presented for bloody diarrhea.
Abnormal PE/Chem/CBC/UA Results: x-rays revealed baseball sized mass in the mid abdomen.
Ultrasound performed. Fecal Negative

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes was noted. Ureteral papillae were normal.

The **kidneys** revealed normal size and structure, corticomedullary definition and ratio for this age. The cortices presented largely uniform texture with normal echogenic relationship to liver and spleen. Medullary structure differed distinctly from the cortex and no evidence of pelvic dilation was present. The capsules were acceptably uniform without significant irregularities. The left kidney measured 8.1 cm. The right kidney measured 6.2 cm.

Adrenal Glands

Both **adrenal glands** were visualized and recognized as having normal shape, size, position and echogenicity for this breed. The phrenic vasculature, glandular echogenicity and detail were unremarkable. Capsule, cortex, and medullary definition were normal for this age patient. The left adrenal gland measured 2.03 x 0.49 cm at the cranial pole and 0.36 cm at the caudal pole.

Spleen

A mixed hypoechoic 7.2 cm parenchymal and cystic mass was noted in the mid abdomen. This was deriving from caudal pole of the **spleen**. There was no evidence of mass rupture and no overt evidence of metastatic disease.

Liver

The **liver** images submitted revealed subjectively normal liver size, contour, and structure. Parenchymal echogenicity was naturally coarse and hypoechoic to the spleen. Vascular and biliary tracts were of normal volume with no evidence of congestion. The gallbladder presented acceptably thin walls with primarily anechoic content. The cystic and common bile ducts were normal. No pathological hepatic lymphadenopathy was evident. No overt structural evidence of inflammatory, infiltrative or regenerative pathology was evident.

Gastrointestinal

Examination of the **gastrointestinal tract** revealed a stomach and intestine free of stasis, of normal wall thickness, acceptable curvilinear mural detail, and peristaltic activity. Small and large intestine

PATIENT

Kimbo Drake

demonstrated normal luminal chyme and stool consistency respectively. No obstructive or overt infiltrative disease was noted. No associated abnormal lymphatic activity was noted.

SPECIES

Canine

Pancreas

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

BREED

German Shepherd

Heart

SEX

Male

Rapid view of the heart revealed no evidence of pathology.

ULTRASONOGRAPHIC FINDINGS

AGE

12 years

Splenic mass, solitary. This may be histopathologically benign. Hemangiosarcoma, benign hematoma

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

WEIGHT

84 lbs

There is no overt evidence of metastatic disease. Three view chest radiographs are warranted followed by exploratory surgery/splenectomy.
