

PATIENT

Benny Alexander

SPECIES

Canine

BREED

Labrador

SEX

Neutered male

AGE

5 years

WEIGHT

76 lbs

INTERPRETED BY

Eric Lindquist, DMV
DABVP, Cert. IVUSS

IMAGING PERFORMED BY

Laura Klaassen

HOSPITAL NAME

Animal Care Group of
Lake Oswego

REFERRING VET

Dr. Wisniewski

INVOICE

75130

DATE

5/1/26

PRESENTING CLINICAL SIGNS

History: new murmur no clinical signs
Grade I/VI L apical

ULTRASONOGRAPHIC EXAMINATION OF THE HEART

The echocardiogram in this patient demonstrated normal **left atrial** size based on 3 different LA measurement methods. Chamber volumes and echogenicity were normal. The cranial and caudal **mitral** valve leaflets presented vegetative thickening consistent with endocardiosis. Doppler indicated measurable insufficiency. The **left ventricle** presented thicknesses with linear contour and was not dilated nor restricted. The **myocardium** presented normal echogenicity without subjective evidence of significant fibrotic or ischemic disease. **Contractility** of the ventricular walls was adequate and in normal range for this patient evidenced by the fractional shortening measurement and subjective evaluation of the different regions of the myocardium. The **left ventricular outflow** tract demonstrated normal laminar flow and subjective structural integrity. The **right atrium** and auricle revealed normal size, structure and content. No evidence of masses was noted or chamber overload. **Tricuspid** valvular assessment demonstrated adequate linear morphology. The **right ventricle** was of normal size (1/3 diameter of LV), chordae structure, myocardial echogenicity and thickness. **Pulmonic** tract assessment revealed normal valve structure, laminar flow, and diameter (approx.1:1 pa/ao ratio). No visible **pericardial** or free pleura fluid was noted. No echographically detectable evidence of infiltrative disease was visible. The cranial **mediastinum and pericardial regions** were free of masses in the visible window.

ULTRASONOGRAPHIC FINDINGS

Trivial mitral insufficiency, not clinically significant.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

There was no evidence of arrhythmogenic activity at the time of the sonogram. However, given the VPC history a Holter monitor would be ideal to assess the character and quality of the VPC's over a 24-hour period as well as any other arrhythmogenic activity. This can be obtained from our office with cardiologist review. Spectral Doppler evaluation is recommended for elevated outflow velocities would also be indicated. However, there was no structural evidence of disease.
