

PATIENT	PRESENTING CLINICAL SIGNS
Dexter Overmeyer	5/8/26: 24 hr history of lethargy and anorexia. -Pet also PU/PD but this was noted 4/2/26
SPECIES	Abnormal PE/Chem/CBC/UA Results: 5/8/26 PE pain on abdominal palpation in mid-abdomen; BW-mild anemia, leukocytosis with neutrophilia, azotemia, mild ALT elevation, hypokalemia; Abdominal radiographs suspicious for abdominal mass
Canine	
BREED	ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN
Australian Shepherd Mix	Urinary System The urinary bladder was overdistended with mild apical wall thickening, measuring 0.54 cm in width.
SEX	The kidneys revealed normal size and structure, corticomedullary definition and ratio for this age. The cortices presented largely uniform texture with normal echogenic relationship to liver and spleen. Medullary structure differed distinctly from the cortex and no evidence of pelvic dilation was present. The capsules were acceptably uniform without significant irregularities.
MN	
AGE	The left kidney measured 6.9 cm The right kidney measured 6.2 cm.
8yr	
WEIGHT	Adrenal Glands The region of the left adrenal gland revealed an extensive undifferentiated mass, occupying the area of the left adrenal and sublumbar space. The right adrenal gland was not visualized.
31kg	
INTERPRETED BY	Spleen The spleen presented a smooth homogeneous parenchyma hyperechoic to liver and renal cortical parenchyma. The capsule was smooth without noticeable expansion or deviation from within the spleen or adjacent pathology. The splenic vasculature demonstrated normal volume without signs of congestion or thrombosis. No sonographic evidence of acute or chronic inflammatory, neoplastic, or infarctual changes was noted.
Eric Lindquist, DMV DABVP, Cert. IVUSS	
IMAGING PERFORMED BY	Liver The liver images submitted revealed subjectively normal liver size, contour, and structure. Parenchymal echogenicity was naturally coarse and hypoechoic to the spleen. Vascular and biliary tracts were of normal volume with no evidence of congestion. The gallbladder presented acceptably thin walls with primarily anechoic content. The cystic and common bile ducts were normal. No pathological hepatic lymphadenopathy was evident. No overt structural evidence of inflammatory, infiltrative or regenerative pathology was evident.
Dr. Hayley Gaynor	
HOSPITAL NAME	Gastrointestinal Examination of the gastrointestinal tract revealed a stomach and intestine free of stasis, of normal wall thickness, acceptable curvilinear mural detail, and peristaltic activity. Small and large intestine

PATIENT

Dexter Overmeyer

demonstrated normal luminal chyme and stool consistency respectively. No obstructive or overt infiltrative disease was noted. No associated abnormal lymphatic activity was noted.

Pancreas

SPECIES

Canine

The base and limbs of the pancreas were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal, and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

ULTRASONOGRAPHIC FINDINGS

BREED

Australian Shepherd
Mix

- Undifferentiated mass in the region of the left adrenal gland, presumed to be pheochromocytoma extending in the sublumbal space, not resectable

SEX

MN

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

FNA could be considered for further definition presuming this mass is deriving from the left adrenal gland, however, lymph node or intestinal origin also technically possible. The mesentery and intestines were deviated around the mass, with a significant amount of inflammation present.

AGE

8yr

This does not appear to be a surgical option. FNA and chemotherapeutic intervention recommended.
