

PATIENT

Paris Garcia

SPECIES

Canine

BREED

Boston Terrier

SEX

Spayed female

AGE

8 years

WEIGHT

20.4 lbs

PRESENTING CLINICAL SIGNS

History: Intermittent vomiting, home cooked meals aren't helping
Pepcid, ondansetron & metoclopramide not resolving
PE: mild discomfort on deep abdominal palpation

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes was noted. Ureteral papillae were normal.

The **kidneys** revealed largely normal size and structure, corticomedullary definition and ratio (cortex 1/3 of medulla) were essentially maintained with some age-related loss of curvilinear patterns regarding the capsule and C/M junction. The cortices presented largely uniform texture with some increased echogenicity expected for this age patient. Medullary structure differed distinctly from that of the cortex and no evidence of pelvic dilation was present. The left kidney measured 3.4 cm. The right kidney measured 4.6 cm.

INTERPRETED BY

Eric Lindquist, DMV
DABVP, Cert. IVUSS

Adrenal Glands

The left **adrenal gland** was mildly swollen and measured 0.8 cm. The right adrenal gland was also swollen and measured 0.96 cm.

IMAGING PERFORMED BY

Chelsea Pastor

Spleen

The **spleen** presented a smooth homogeneous parenchyma hyperechoic to liver and renal cortical parenchyma. The capsule was smooth without noticeable expansion or deviation from within the spleen or adjacent pathology. The splenic vasculature demonstrated normal volume without signs of congestion or thrombosis. No sonographic evidence of acute or chronic inflammatory, neoplastic, or infarctual changes was noted.

REFERRING VET

Dr. Grau

Liver

The **liver** images submitted revealed subjectively normal liver size, contour, and structure. Parenchymal echogenicity was naturally coarse and hypoechoic to the spleen. Vascular and biliary tracts were of normal volume with no evidence of congestion. The gallbladder presented acceptably thin walls with primarily anechoic content. The cystic and common bile ducts were normal. No pathological hepatic lymphadenopathy was evident. No overt structural evidence of inflammatory, infiltrative or regenerative pathology was evident.

Gastrointestinal

The **stomach** revealed fluid filled lumen. Normal curvilinear mural patterns were noted. There was no evidence of neoplasia or foreign bodies. The small intestines and colon were unremarkable with normal curvilinear mural patterns and content.

Pancreas

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

ULTRASONOGRAPHIC FINDINGS

Structurally unremarkable abdomen.

Sonographically insignificant gastritis.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Given that empirical measures were noted effective adding Zithromax to the GI protectant protocol may prove effective. Otherwise, endoscopy is indicated. Strict hydrolyzed, canned b.i.d. feedings of a hydrolyzed diet may be helpful.
