PRESENTING CLINICAL SIGNS

History of severe atopy, chronic vomiting and anorexia, urine leakage.

All values WNL, including CBC/Chem/T4

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The **urinary bladder**, trigone, and pelvic urethra to a depth of 2.0 cm presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized, and anechoic urine was present. No evidence of inflammatory or neoplastic changes were noted. Ureteral papillae were normal.

The **kidneys** revealed normal size and structure, corticomedullary definition and ratio for this age. The cortices presented largely uniform texture with normal echogenic relationship to liver and spleen. Medullary structure differed distinctly from the cortex and no evidence of pelvic dilation was present. The capsules were acceptably uniform without significant irregularities. The left kidney measured 6.1 cm in length. The right kidney measured 6.1 cm in length.

Adrenal Glands

The **right adrenal gland** was normal in size and contour. The right adrenal gland measured 0.8 cm width at the cranial pole and 0.5 cm width at the caudal pole.

The **left adrenal gland** was visualized obliquely and somewhat flattened measuring 0.33 cm width.

Spleen

The **spleen** presented mildly enlarged and folded upon itself cranially.

Liver

The **liver** images submitted revealed subjectively normal liver size, contour, and structure. Parenchymal echogenicity was naturally coarse and hypoechoic to the spleen. Vascular and biliary tracts were of normal volume with no evidence of congestion. The gallbladder presented acceptably thin walls with primarily anechoic content. The cystic and common bile ducts were normal. No pathological hepatic lymphadenopathy was evident. No overt structural evidence of inflammatory, infiltrative or regenerative pathology was evident.

Gastrointestinal

The **stomach** was filled with ingesta. The small intestine was empty. The colon revealed normal stool consistency.

Pancreas

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal, and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

ULTRASONOGRAPHIC FINDINGS

PATIENT

Henry Page

- Full stomach with ingesta or potential foreign matter.
- Flattened left adrenal gland.
- Splenic enlargement.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Screening for underlying Addison's in this patient particularly the left adrenal gland. Cannot rule out soft foreign matter such as grass or similar in the stomach. Baseline cortisol to assess for potential occult Addison's. Endoscopy would be ideal for further definition to inspect the stomach and obtain mucosal biopsies, yet no evidence of gross disease in this patient other than possible non-obstructive soft foreign matter in the stomach depending on when the patient ate prior to the sonogram.
