DATE

5/23/22

PRESENTING CLINICAL SIGNS

p presented for respiratory distress p has been diagnosed and started treatment for anemia and UTI at RDVM p did not improve p diagnosed with CHF and HCM here at our hospital p still not eating PCV has been 18% and Total Solids 17

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes were noted. Ureteral papillae were normal.

The **kidneys** presented normal size and contour. Mild increased cortical echogenicity, non-specific mild degenerative change. The right kidney measured 3.5 cm. The left kidney measured 3.5 cm.

Adrenal Glands

The regions of the **adrenal glands** were unremarkable.

Spleen

The **spleen** presented a smooth homogeneous parenchyma hyperechoic to liver and renal cortical parenchyma. The capsule was smooth without noticeable expansion or deviation from within the spleen or adjacent pathology. The splenic vasculature demonstrated normal volume without signs of congestion or thrombosis. No sonographic evidence of acute or chronic inflammatory, neoplastic, or infarctual changes were noted.

Liver

The **liver** presented coarse architecture and mild increased portal markings. Minor uniform swelling. Duplicated gallbladder noted.

Comet tail lung pattern noted through the diaphragm. Radiographic or CT assessment for alveolar disease indicated.

Gastrointestinal

Examination of the **gastrointestinal tract** revealed a stomach and intestine free of stasis, of normal wall thickness, acceptable curvilinear mural detail, and peristaltic activity. Small and large intestine demonstrated normal luminal chyme and stool consistency respectively. No obstructive or overt infiltrative disease was noted. Slight reactive mesenteric lymph node noted in the mid abdomen, 1.0 cm.

Pancreas

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

ULTRASONOGRAPHIC FINDINGS

- Unremarkable abdomen

PATIENT

Stella Burke

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Largely age related changes. Clinical management should be based on thoracic signs. Echocardiogram indicated +/- chest CT. No evidence of primary disease in the abdomen to be directly related to the respiratory presentation.
