PRESENTING CLINICAL SIGNS

P not eating for days plus vomiting then went to RDVM Tuesday, BW and rads normal gave cerenia and SQ fluids plus mirtazapine, P no longer vomiting but still not eating. Fpli performed a few hours ago was normal. P currently being treated symptomatically with IV fluids and IV cerenia. Abdominal ultra sound performed and sending out.

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes were noted. Ureteral papillae were normal.

The **kidneys** revealed normal size and structure, corticomedullary definition and ratio for this age. The cortices presented largely uniform texture with normal echogenic relationship to liver and spleen. Medullary structure differed distinctly from the cortex and no evidence of pelvic dilation was present. The capsules were acceptably uniform without significant irregularities. The kidneys measured 3.0 cm each.

Adrenal Glands

The regions of the **adrenal glands** were unremarkable.

Spleen

The **spleen** presented a smooth homogeneous parenchyma hyperechoic to liver and renal cortical parenchyma. The capsule was smooth without noticeable expansion or deviation from within the spleen or adjacent pathology. The splenic vasculature demonstrated normal volume without signs of congestion or thrombosis. No sonographic evidence of acute or chronic inflammatory, neoplastic, or infarctual changes were noted.

Liver

The **liver** images submitted revealed subjectively normal liver size, contour, and structure. Parenchymal echogenicity was naturally coarse and hypoechoic to the spleen. Vascular and biliary tracts were of normal volume with no evidence of congestion. The gallbladder presented acceptably thin walls with primarily anechoic content. The cystic and common bile ducts were normal. No pathological hepatic lymphadenopathy was evident. No overt structural evidence of inflammatory, infiltrative or regenerative pathology was evident.

Gastrointestinal

The **stomach** itself was unremarkable. Spastic small intestine noted, yet empty lumen. No evidence of foreign bodies. Reactive mesenteric lymph nodes noted, measuring 1.0 cm x 0.5 cm.

Pancreas

The right limb of the **pancreas** was slightly heterogeneous. Right subxiphoid palpation warranted to assess for any discomfort associated with the pancreas.

ULTRASONOGRAPHIC FINDINGS

- Non-specific enteritis with reactive mesenteric lymph nodes

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Pain management warranted and assessment for extraabdominal disease that may be playing a role, such as orthopedic pain, thoracic or CNS disease. GI protectants and fluid support indicated. No evidence of significant visceral disease from a sonographic perspective.
