PRESENTING CLINICAL SIGNS

History: defecated string/ fb diarrhea, parasites /roundworms

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized, and anechoic urine was present. No evidence of inflammatory or neoplastic changes were noted. Ureteral papillae were normal.

The **kidneys** revealed hyperechoic medullary rim sign. Both kidneys were mildly enlarged and hypervascular. The right kidney measured 5.02 cm. The left kidney measured 5.0 cm.

Adrenal Glands

The regions of the **adrenal glands** revealed no evident pathology.

Spleen

The **spleen** was mildly enlarged, measuring 1.28 cm in width.

Liver

The **liver** revealed increased portal markings and coarse architecture. The gallbladder and common bile duct were unremarkable.

Gastrointestinal

Examination of the **gastrointestinal tract** revealed a stomach and intestine free of stasis, of normal wall thickness, acceptable curvilinear mural detail, and peristaltic activity. Small and large intestine demonstrated normal luminal chyme and stool consistency respectively. No obstructive or overt infiltrative disease was noted. No associated abnormal lymphatic activity was noted.

Pancreas

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal, and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

Free Abdomen

The mesenteric **lymph nodes** were mildly enlarged and rounded, measuring up to 1.0 cm in length. Some reactive mesentery was noted in the mid abdomen.

ULTRASONOGRAPHIC FINDINGS

- Medullary rim kidneys
- Splenic enlargement
- Lymphadenopathy
- Reactive mesentery in the abdomen
- Increased portal markings and coarse architecture noted in the liver

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Concern for underlying FIP may be emerging in this patient. Lymphadenitis and enteritis likely. No evidence of foreign bodies. FNA of the spleen +/- kidneys recommended to assess for granulomatous disease, if clinical signs persist.
