

PATIENT

Brody Moreno

PRESENTING CLINICAL SIGNS

History: recheck previous u/s on 5/13 shows a splenic nodule

SPECIES

Canine

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

BREED

Cockapoo

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes was noted. Ureteral papillae were normal.

SEX

Neutered male

The **kidneys** revealed largely normal size and structure, corticomedullary definition and ratio (cortex 1/3 of medulla) were essentially maintained with some age-related loss of curvilinear patterns regarding the capsule and C/M junction. The cortices presented largely uniform texture with some increased echogenicity expected for this age patient. Medullary structure differed distinctly from that of the cortex and no evidence of pelvic dilatation was present. The right kidney measured 4.15 cm. The left kidney measured 4.17 cm.

AGE

7 years

WEIGHT

23 lbs

Adrenal Glands

Both **adrenal glands** were visualized and recognized as having normal shape, size, position and echogenicity for this breed. The phrenic vasculature, glandular echogenicity and detail were unremarkable. Capsule, cortex, and medullary definition were normal for this age patient. The right adrenal gland measured 1.8 x 0.87 cm at the cranial and 0.55 cm at the caudal pole. The left adrenal gland measured 1.53 x 0.46 cm at the caudal pole and 0.52 cm at the cranial pole.

INTERPRETED BY

Eric Lindquist, DMV
DABVP, Cert. IVUSS

IMAGING PERFORMED BY

Jenn

Spleen

The **spleen** was largely normal with a residual, focal, hypoechoic nodule measuring 0.5 cm. This is non-disruptive.

HOSPITAL NAME

Rockaway AH

Liver

The **liver** images submitted revealed subjectively normal liver size, contour, and structure. Parenchymal echogenicity was naturally coarse and hypoechoic to the spleen. Vascular and biliary tracts were of normal volume with no evidence of congestion. The gallbladder presented acceptably thin walls with primarily anechoic content. The cystic and common bile ducts were normal. No pathological hepatic lymphadenopathy was evident. No overt structural evidence of inflammatory, infiltrative or regenerative pathology was evident.

Gastrointestinal

DATE

5/31/22

The **stomach** revealed minor shadowing material. This is likely medications or similar and measured up to 1.0 cm. There was a minor amount of ingesta. The small intestines and colon were unremarkable.

PATIENT

Pancreas

Brody Moreno

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

SPECIES

Canine

ULTRASONOGRAPHIC FINDINGS

BREED

Cockapoo

Stable splenic nodule.

Minor, shadowing gastric material, likely medications. However, small foreign matter cannot be ruled out.

SEX

Otherwise, unremarkable abdomen.

Neutered male

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

AGE

No specific therapy is recommended.
