

PATIENT PRESENTING CLINICAL SIGNS

PATIENT: Mee Mee Little
SPECIES: Canine
BREED: Poodle Cross Lab
SEX: Spayed Female
AGE: 8 years
WEIGHT: 33.2 lbs

PRESENTING CLINICAL SIGNS: New heart murmur noted as incidental finding. No clinical signs associated. Abnormal PE/Chem/CBC/UA Results: Initial Presenting Complaint - was seen at different vet clinic for GI upset in March 2022; diagnosed with new murmur and enlarged heart on chest rads Clinical Signs: none Significant/ relevant exam findings: - Grade 3/6 murmur on exam Apr 7; normal HR and lung sounds Lab work performed: N Date: Findings: Radiographs: Y - Uptown (attached to file) Date: Mar 2022 Findings: VHS 11 Current Medications: - none

BREED ULTRASONOGRAPHIC EXAMINATION OF THE HEART

The echocardiogram in this patient demonstrated normal **left atrial** size based on 3 different LA measurement methods. Chamber volumes and echogenicity were normal. The cranial and caudal **mitral** valve leaflets presented vegetative thickening consistent with endocardiosis. Doppler indicated measurable insufficiency. The **left ventricle** presented thicknesses with linear contour and was not dilated nor restricted. The **myocardium** presented normal echogenicity without subjective evidence of significant fibrotic or ischemic disease. **Contractility** of the ventricular walls was adequate and in normal range for this patient evidenced by the fractional shortening measurement and subjective evaluation of the different regions of the myocardium. The **left ventricular outflow** tract demonstrated normal laminar flow and subjective structural integrity. The **right atrium** and auricle revealed normal size, structure and content. No evidence of masses was noted or chamber overload. **Tricuspid** valvular assessment demonstrated adequate linear morphology. The **right ventricle** was of normal size (1/3 diameter of LV), chordae structure, myocardial echogenicity and thickness. **Pulmonic** tract assessment revealed normal valve structure, laminar flow, and diameter (approx.1:1 pa/ao ratio). No visible **pericardial** or free pleura fluid was noted. No echographically detectable evidence of infiltrative disease was visible. The cranial **mediastinum** and **pericardial** regions were free of masses in the visible window.

ULTRASONOGRAPHIC FINDINGS

Stage B1 valvular disease.

SPECIES

Canine

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

There is no evidence of volume overload.

BREED

Poodle Cross Lab

B1: The heart is stable without clinical disease. No overt contraindication for anesthesia of brief to moderate duration. I suggest Torbutrol premed, Propofol induction, Isoflurane maintenance or similar protocol if anesthesia is desired. Blood pressure recommended if not already performed and target white coat negative systolic pressure of < 160 mmHg. If higher than this ACE-inhibitor is suggested to reach this level. Recheck echocardiogram is recommended in 6 months, earlier if murmur grade increases or clinical signs initiate.
