PRESENTING CLINICAL SIGNS

Abdominal fluid. Prev. U/S by rDVM reported-moderate inflammation of omentum and intestinal tract. Small pockets of free abdominal fluid embedded within organs. Depo Medrol administered 5/20, transdermal Mirtazapine 5g 1 \$ 1/4 strip sid

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. Minor amount of suspended debris present. No evidence of inflammatory or neoplastic changes were noted. Ureteral papillae were normal.

The **kidneys** revealed largely normal size and structure, corticomedullary definition and ratio (cortex 1/3 of medulla) were essentially maintained with some age-related loss of curvilinear patterns regarding the capsule and C/M junction. The cortices presented largely uniform texture with some increased echogenicity expected for his age patient. Medullary structure differed distinctly from that of the cortex and no evidence of pelvic dilation was present. The right kidney measured 4.78 cm. The left kidney measured 4.33 cm.

Adrenal Glands

The regions of the **adrenal glands** were unremarkable.

Spleen

The **spleen** appeared severely volume contracted.

Liver

The **liver** images from right and left intercostal as well as subcostal views revealed subjectively normal liver size, contour, and structure. Some age-related parenchymal remodeling was noted but likely not clinically significant at this time. Vascular and biliary tracts were of normal volume and no evidence of congestion was noted. The gallbladder presented some dependent debris with essentially normal contour. The cystic and common bile ducts were normal. No overt evidence of active inflammatory, infiltrative or regenerative pathology was noted but should be paired with current or past LE elevations regarding any clinical significance to this presentation. The hepatic lymph nodes were unremarkable.

Gastrointestinal

Examination of the **gastrointestinal tract** revealed a stomach and intestine free of stasis, of normal wall thickness, acceptable curvilinear mural detail, and peristaltic activity. Small and large intestine demonstrated normal luminal chyme and stool consistency respectively. No obstructive or overt infiltrative disease was noted. No associated abnormal lymphatic activity was noted.

Pancreas

Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. Coalesced nodular omentum noted around the pancreas, enveloping the upper gastrointestinal tract, strongly consistent with carcinomatosis, lymphomatosis, or similar.

Free Abdomen

Large amount of echogenic free fluid noted in the abdomen.

PATIENT

Spanky Bassett

ULTRASONOGRAPHIC FINDINGS

- Carcinomatosis/lymphomatosis type presentation

SPECIES

Feline

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Abdominocentesis and rapid cytospin with immediate slide preparation recommended to confirm suspicion of exfoliating neoplasia.
