

**PATIENT**

Fanny Gaiser

**PRESENTING CLINICAL SIGNS**

History: anorexia

**SPECIES**

Canine

**ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN**

**Urinary System**

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes were noted. Ureteral papillae were normal.

**BREED**

Dachshund

The **kidneys** revealed normal size and structure, corticomedullary definition and ratio for this age. The cortices presented largely uniform texture with normal echogenic relationship to liver and spleen. Medullary structure differed distinctly from the cortex and no evidence of pelvic dilation was present. The capsules were acceptably uniform without significant irregularities. The right kidney measured 3.85 cm. The left kidney measured 4.4 cm.

**SEX**

Spayed Female

**AGE**

8 Years

**Adrenal Glands**

Both **adrenal glands** were visualized and recognized as having normal shape, size, position and echogenicity for this breed. The phrenic vasculature, glandular echogenicity and detail were unremarkable. Capsule, cortex, and medullary definition were normal for this age patient. The left adrenal gland measured 1.72 cm x 0.44 cm at the caudal pole and 0.51 cm at the cranial pole. The right adrenal gland measured 1.86 cm x 0.65 cm at the caudal pole and 0.85 cm at the cranial pole.

**WEIGHT**

15.2 Pounds

**Spleen**

The **spleen** presented a smooth homogeneous parenchyma hyperechoic to liver and renal cortical parenchyma. The capsule was smooth without noticeable expansion or deviation from within the spleen or adjacent pathology. The splenic vasculature demonstrated normal volume without signs of congestion or thrombosis. No sonographic evidence of acute or chronic inflammatory, neoplastic, or infarctual changes were noted.

**INTERPRETED BY**

Eric Lindquist, DMV  
DABVP, Cert. IVUSS

**IMAGING PERFORMED BY**

Jenn

**Liver**

The **liver** was significantly subnormal in size. The gallbladder and common bile duct were unremarkable. No obvious portosystemic shunts noted, however, bile acid profile warranted. If elevated, further imaging of the portal vein to vena cava ratio is recommended.

**HOSPITAL NAME**

Rockaway AH

**Gastrointestinal**

Examination of the **gastrointestinal tract** revealed a stomach and intestine free of stasis, of normal wall thickness, acceptable curvilinear mural detail, and peristaltic activity. Small and large intestine demonstrated normal luminal chyme and stool consistency respectively. No obstructive or overt infiltrative disease was noted. No associated abnormal lymphatic activity was noted.

**REFERRING VET**

Dr. Bednar

**INVOICE**

16051

**Pancreas**

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

**DATE**

6/13/22

## PATIENT

Fanny Gaiser

## ULTRASONOGRAPHIC FINDINGS

- Microhepatica. Portal hypoplasia versus non-evident portosystemic shunting
- Unremarkable abdomen otherwise

## SPECIES

Canine

## INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The cause of anorexia is unclear. Bile acid profile is warranted. Assessment for orthopedic pain, CNS or thoracic disease all indicated.

## BREED

Dachshund

## SEX

Spayed Female

## AGE

8 Years

## WEIGHT

15.2 Pounds
