

PATIENT PRESENTING CLINICAL SIGNS

Lyla Jones v/d recheck , started V+ at home

SPECIES ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Canine Urinary System

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes were noted. Ureteral papillae were normal.

BREED

Golden Retriever

SEX

Spayed Female

AGE

2 Years 6 Months

The **kidneys** revealed normal size and structure, corticomedullary definition and ratio for this age. The cortices presented largely uniform texture with normal echogenic relationship to liver and spleen. Medullary structure differed distinctly from the cortex and no evidence of pelvic dilation was present. The capsules were acceptably uniform without significant irregularities. The left kidney measured 6.33 cm. The right kidney measured 5.96 cm.

Adrenal Glands

WEIGHT

57 Pounds

Both **adrenal glands** appear mildly subnormal in size for this breed and age. The right adrenal gland measured 1.25 cm x 1.05 cm at the cranial pole and 0.31 cm at the caudal pole. The left adrenal gland measured 1.51 cm x 0.31 cm at the caudal pole and 0.21 cm at the cranial pole.

INTERPRETED BY Spleen

Eric Lindquist, DMV

DABVP, Cert. IVUSS

The **spleen** presented a smooth homogeneous parenchyma hyperechoic to liver and renal cortical parenchyma. The capsule was smooth without noticeable expansion or deviation from within the spleen or adjacent pathology. The splenic vasculature demonstrated normal volume without signs of congestion or thrombosis. No sonographic evidence of acute or chronic inflammatory, neoplastic, or infarctual changes were noted.

IMAGING PERFORMED BY

Val Shumskaya

Liver

HOSPITAL NAME

Rockaway AH

The **liver** images submitted revealed subjectively normal liver size, contour, and structure. Parenchymal echogenicity was naturally coarse and hypoechoic to the spleen. Vascular and biliary tracts were of normal volume with no evidence of congestion. The gallbladder presented acceptably thin walls with primarily anechoic content. The cystic and common bile ducts were normal. No pathological hepatic lymphadenopathy was evident. No overt structural evidence of inflammatory, infiltrative or regenerative pathology was evident.

REFERRING VET

Dr. Maniar

Gastrointestinal

INVOICE

43143

The **stomach** was overdistended with fluid and chyme. The gastric wall was mildly thickened. The pylorus appears free of evident pathology. The small intestine was empty, as well as the ileocecal junction.

DATE

6/14/23

Pancreas

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

ULTRASONOGRAPHIC FINDINGS

- Gastritis pattern, minor stasis/delayed outflow pattern
- Flattened adrenal glands

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Screening for Addison's warranted if not already performed. GI protectant protocol or endoscopy indicated, given the patient history.
