PRESENTING CLINICAL SIGNS

History: Presented on 6/17/22 for hematuria.

Abnormal PE/Chem/CBC/UA Results: Enlarged Vulva with mild hemorrhagic discharge, Suspect resistant UTI; R/O vaginitis, ovarian remnant/heat cycle, open Urine Culture- E. Coli AMH - Positive Progesterone - (6.83), indicative of ovarian remnant

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN**Urinary System**

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes was noted. Ureteral papillae were normal.

Cystic right ovary was noted and measured 2.78 x 1.8 cm. Hypoechoic, 1.13 x 0.4 cm structure was noted in the left ovarian fossa. The uterus was thickened and measured 1.71 cm with minor luminal fluid.

The **kidneys** revealed normal size and structure, corticomedullary definition and ratio for this age. The cortices presented largely uniform texture with normal echogenic relationship to liver and spleen. Medullary structure differed distinctly from the cortex and no evidence of pelvic dilation was present. The capsules were acceptably uniform without significant irregularities. The right kidney measured 7.33 cm. The left kidney measured 7.58 cm.

Adrenal Glands

Both **adrenal glands** were visualized and recognized as having normal shape, size, position and echogenicity for this breed. The phrenic vasculature, glandular echogenicity and detail were unremarkable. Capsule, cortex, and medullary definition were normal for this age patient. The right adrenal gland measured 0.53 cm at the caudal pole and 0.81 cm at the cranial pole. The left adrenal gland measured 0.51 cm at the caudal pole and 0.4 cm at the cranial pole.

Spleen

The **spleen** presented a smooth homogeneous parenchyma hyperechoic to liver and renal cortical parenchyma. The capsule was smooth without noticeable expansion or deviation from within the spleen or adjacent pathology. The splenic vasculature demonstrated normal volume without signs of congestion or thrombosis. No sonographic evidence of acute or chronic inflammatory, neoplastic, or infarctual changes was noted.

Liver

The **liver** images submitted revealed subjectively normal liver size, contour, and structure. Parenchymal echogenicity was naturally coarse and hypoechoic to the spleen. Vascular and biliary tracts were of normal volume with no evidence of congestion. The gallbladder presented acceptably thin walls with primarily anechoic content. The cystic and common bile ducts were normal. No pathological hepatic lymphadenopathy was evident. No overt structural evidence of inflammatory, infiltrative or regenerative pathology was evident.

Gastrointestinal

Examination of the **gastrointestinal tract** revealed a stomach and intestine free of stasis, of normal wall thickness, acceptable curvilinear mural detail, and peristaltic activity. Small and large intestine demonstrated normal luminal chyme and stool consistency respectively. No obstructive or overt infiltrative disease was noted. No associated abnormal lymphatic activity was noted.

Pancreas

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

ULTRASONOGRAPHIC FINDINGS

Uterine heat stump and cystic right ovarian remnant.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Minor, hypoechoic tissue in the region of the right ovarian fossa. I suspect minor left ovarian remnant. I recommend surgical exploratory with removal of the residual tissue, both ovarian fossa and resection of the remaining uterine stump to the cervix with appropriate uterine tissue culture.
