

PATIENT PRESENTING CLINICAL SIGNS

Opie Norsworthy Shaking, stiff, mildly tender on neck. Cervical tumor.

SPECIES Abnormal PE/Chem/CBC/UA Results: Large, hard mass on neck, grew very fast. 8x11cm mass L side consistent with thyroid gland. Labs and cytology pending.

Canine

ULTRASONOGRAPHIC EXAMINATION OF THE CERVICAL REGION
BREED

Australian Shepherd

The cervical region adjacent to the trachea revealed a 7.5 cm x 6.0 cm tissue mass that was largely hypoechoic and disorganized with areas of mineralization. The mass appears encapsulated and appears to be in the thyroid region. Suspect carcinoma. A distorted lymph node cannot be completely ruled out. The mass appears to deviate the esophagus to some extent. A regional salivary gland was unremarkable. A lymph node in the region was also enlarged measuring 1.0 cm x 1.5 cm.

SEX

Neutered Male

ULTRASONOGRAPHIC FINDINGS
AGE

9 Years

- Mass in the cervical region – suspect thyroid carcinoma, possibility of lymph node based tumor yet less likely.

WEIGHT

46 Pounds

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Ultrasound guided FNA and CT for surgical planning warranted. Prognosis is guarded depending upon cytology results and CT results. The mass is significantly undifferentiated.
