ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

BREED

Yorkie

Gastrointestinal

The stomach in this patient presented progressive dilation that continued through the pylorus to the upper duodenum. Significant, hyperechoic, heterogenous parenchyma was noted around the duodenum causing delayed outflow. I do not see an overt foreign body; however, tethering of the upper GI tract appears to be an issue with adhesions.

SEX

Neutered male

ULTRASONOGRAPHIC FINDINGS

AGE

8 years

No overt foreign body noted; however, tethering of the upper GI tract with adhesions appears to be an issue. Progressively dilated stomach.

WEIGHT

10.4 lbs

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

I recommend gastric decompression via gastric tube followed by surgical intervention to liberate the upper duodenum and inspect for any penetrating foreign matter.
