

**PATIENT**

Lucifer Kibalo

**PRESENTING CLINICAL SIGNS**

Vomited string

**SPECIES**

Feline

Abnormal PE/Chem/CBC/UA Results: WNL, Dehydrated

**ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN**

**BREED**

DSH

**Urinary System**

The urinary bladder, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized, and minimal anechoic urine was present. No evidence of inflammatory or neoplastic changes were noted. Ureteral papillae were normal.

**SEX**

MN

The kidneys revealed normal size and structure, corticomedullary definition and ratio for this age. The cortices presented largely uniform texture with normal echogenic relationship to liver and spleen. Medullary structure differed distinctly from the cortex and no evidence of pelvic dilation was present. The capsules were acceptably uniform without significant irregularities. The left kidney measured 4.08 cm in length. The right kidney measured 4.25 cm in length.

**AGE**

4yr

**Adrenal Glands**

Both adrenal glands were visualized and recognized as having normal shape, size, position and echogenicity for this breed. The phrenic vasculature, glandular echogenicity and detail were unremarkable. Capsule, cortex, and medullary definition were normal for this age patient. The left adrenal gland measured 0.46 cm width. The right adrenal gland measured 0.67 cm width.

**WEIGHT**

15lb

**Spleen**

The spleen presented a smooth homogeneous parenchyma hyperechoic to liver and renal cortical parenchyma. The capsule was smooth without noticeable expansion or deviation from within the spleen or adjacent pathology. The splenic vasculature demonstrated normal volume without signs of congestion or thrombosis. No sonographic evidence of acute or chronic inflammatory, neoplastic, or infarctual changes were noted.

**INTERPRETED BY**

Eric Lindquist, DMV  
DABVP, Cert. IVUSS

**Liver**

The liver images submitted revealed subjectively normal liver size, contour, and structure. Parenchymal echogenicity was naturally coarse and hypoechoic to the spleen. Vascular and biliary tracts were of normal volume with no evidence of congestion. The gallbladder presented acceptably thin walls with primarily anechoic content. The cystic and common bile ducts were normal. No pathological hepatic lymphadenopathy was evident. No overt structural evidence of inflammatory, infiltrative or regenerative pathology was evident.

**IMAGING PERFORMED BY**

**Gastrointestinal**

Examination of the gastrointestinal tract revealed gastric stasis. Reactive mesentery was noted associated with the small intestine. A tortuous corrugated pattern was present strongly suggestive of linear foreign body. Potential very thin linear structure was noted in the small intestine yet could not be completely confirmed.

14300ag

**DATE**

07/08/2023

**Pancreas**

**PATIENT**

Lucifer Kibalo

The base and limbs of the pancreas were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal, and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

**SPECIES**

Feline

**Free Abdomen**

No omental masses, overt lymphadenopathy or peritoneal effusion was present.

**BREED**

DSH

**ULTRASONOGRAPHIC FINDINGS**

**SEX**

MN

- Tortuous intestine with accordion pleating and reactive mesentery.
- GI stasis.
- Suspect a very thin foreign body or dysfunctional bowel that necessitates biopsies.

**AGE**

4yr

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

Exploratory surgery is indicated. Examination of the tongue base at sedation for attached thread is advised.

**WEIGHT**

15lb
