PRESENTING CLINICAL SIGNS

meow character changing not eating dry food anymore (used to always eat dry kibble) weight loss lethargic

Abnormal PE/Chem/CBC/UA Results: temp 103.8 sensitive to cranial abd palpation BW mild leukopenia / neutropenia; HCT 20% today (was 23%) otherwise chem/t4/UA wnl (USG 1.048, 2+ protein

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes were noted. Ureteral papillae were normal.

The **kidneys** revealed normal size and structure, corticomedullary definition and ratio for this age. The cortices presented largely uniform texture with normal echogenic relationship to liver and spleen. Medullary structure differed distinctly from the cortex and no evidence of pelvic dilation was present. The capsules were acceptably uniform without significant irregularities. The left kidney measured 4.0 cm. The right kidney measured 4.0 cm.

Adrenal Glands

The regions of the **adrenal glands** were unremarkable.

Spleen

The **spleen** was enlarged, irregular and nodular with swollen contour. Regional free fluid noted, likely secondary to lymphoproliferative pressures.

Liver

The **liver** was slightly irregular in contour with uniform parenchyma. The gallbladder and common bile duct were unremarkable. Mild generalized hepatomegaly noted. Slight free fluid noted between the liver lobes. A hepatic lymph node was slightly enlarged, measuring 1.0 cm x 0.5 cm.

Gastrointestinal

Examination of the **gastrointestinal tract** revealed a stomach and intestine free of stasis, of normal wall thickness, acceptable curvilinear mural detail, and peristaltic activity. Small and large intestine demonstrated normal luminal chyme and stool consistency respectively. No obstructive or overt infiltrative disease was noted.

Pancreas

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

ULTRASONOGRAPHIC FINDINGS

- Splenic infiltrative pattern with potential hepatic involvement and slight hepatic lymphadenopathy

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Ultrasound guided FNA of the spleen and liver recommended for staging purposes. Free fluid likely owing to lymphatic obstruction. Guarded prognosis depending upon cytology results. However, I am strongly concerned for infiltrative disease, possibility of splenitis less likely. CBC path review +/- bone marrow aspirate warranted to assess if related bone marrow disease is present. Chest radiographs warranted to assess for metastatic disease.
