

PATIENT

Noelle Fristachi

SPECIES

Feline

BREED

DSH

SEX

Spayed Female

AGE

14 Years

WEIGHT

12.5 Pounds

PRESENTING CLINICAL SIGNS

History: Cardiac arrhythmia, weight loss, PU/PD since 10/2021. Sometimes gets constipation, O gives Miralax.

Abnormal PE/Chem/CBC/UA Results: Labs normal incl. thyroid. USG 1.016. Urine culture-neg

Cardiac Presentation

The echocardiogram in this patient demonstrated normal **left atrial** size based on 3 separate LA measurements. The cranial and caudal **mitral** valve leaflets presented normal linear structure and kinetics. The **left ventricle** presented normal thicknesses with linear contour and was not dilated nor restricted. The **myocardium** presented normal echogenicity without subjective evidence of significant fibrotic or ischemic disease. **Contractility** of the ventricular walls was adequate and in normal range for this patient evidenced by the fractional shortening measurement and subjective evaluation of the different regions and angles of the myocardium. The **left ventricular outflow** tract demonstrated normal laminar flow and subjective structural integrity. The **right atrium** and auricle revealed normal size, structure and content. No evidence of masses was noted or chamber overload. **Tricuspid** valvular assessment demonstrated adequate linear morphology and kinetics. The **right ventricle** was of normal size (1/3 diameter of LV), chordae structure, myocardial echogenicity and thickness. **Pulmonic** tract assessment revealed normal valve structure, laminar flow, and diameter (approx. 1:1 pa/ao ratio). No visible **pericardial** or free pleura fluid was noted or extra cardiac pathology in the visible planes. Excessive **thoracic fat** was noted in the cranial mediastinum around the heart, creating the appearance of cardiomegaly. Cranial mediastinal fat layer measured approximately 1.0- 1.5 cm was present.

Urinary System

PATIENT

Noelle Fristachi

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes were noted. Ureteral papillae were normal.

SPECIES

Feline

The **kidneys** presented a relatively uniform cortical hyperechogenicity when compared to the renal medulla, spleen and liver. No overt masses were noted. Corticomedullary definition was nebulous and the ratio favored the cortex slightly. The ureters were not visible and assumed to be normal. These changes are most consistent with chronic interstitial nephritis yet infiltrative disease could not be entirely ruled out without biopsy though neoplasia is not suspected. This is a moderate change. The right kidney measured 4.03 cm. The left kidney measured 3.42 cm.

BREED

DSH

Adrenal Glands

SEX

Spayed Female

The **left adrenal gland** was visualized and recognized as having normal shape, size, position and echogenicity for this breed. The phrenic vasculature, glandular echogenicity and detail were unremarkable. Capsule, cortex, and medullary definition were normal for this age patient. The left adrenal gland measured 0.42 cm.

AGE

14 Years

The region of the **right adrenal gland** revealed no evident pathology.

Spleen

WEIGHT

12.5 Pounds

The **spleen** presented a smooth homogeneous parenchyma hyperechoic to liver and renal cortical parenchyma. The capsule was smooth without noticeable expansion or deviation from within the spleen or adjacent pathology. The splenic vasculature demonstrated normal volume without signs of congestion or thrombosis. No sonographic evidence of acute or chronic inflammatory, neoplastic, or infarctual changes were noted.

INTERPRETED BY

Eric Lindquist, DMV
DABVP, Cert. IVUSS

Liver

IMAGING PERFORMED BY

Shari Reffi, CVT

The **liver** images from right and left intercostal as well as subcostal views revealed subjectively normal liver size, contour, and structure. Some mild age-related parenchymal remodeling was noted but likely not clinically significant at this time. Vascular and biliary tracts were of normal volume and no evidence of congestion was noted. The gallbladder and common bile duct were unremarkable. Hyperechoic nodules were noted in the left cranial liver- these appear to be stable. However, if any weight loss is present, then FNA is indicated.

Gastrointestinal

REFERRING VET

Dr. Dulude

Examination of the **gastrointestinal tract** revealed a stomach and intestine free of stasis, of normal wall thickness, acceptable curvilinear mural detail, and peristaltic activity. Small and large intestine demonstrated normal luminal chyme and stool consistency respectively. No obstructive or overt infiltrative disease was noted. No associated abnormal lymphatic activity was noted.

INVOICE

16910

Pancreas

The **pancreas** revealed mixed hypoechoic nodular changes in the left limb, measuring 2.06 cm x 0.8 cm.

DATE

8/19/22

ULTRASONOGRAPHIC FINDINGS

- Normal echocardiogram with excessive thoracic fat

PATIENT

Noelle Fristachi

- Geriatric abdomen
- Nodular pancreatic changes, likely hyperplasia with a history of pancreatitis
- Hepatic nodules

SPECIES

Feline

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Given the weight loss, FNA of the pancreas and liver recommended. No cardiac medications recommended.
