PRESENTING CLINICAL SIGNS

History: Abdominal mass

Abnormal PE/Chem/CBC/UA Results: WNL

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The **urinary bladder** was nearly empty with concentric thickening.

The **right kidney** measured A 6.4 cm x 3.7 cm with a mass measuring 5.0 cm deriving from the cranial pole.

The **left kidney** revealed minor age-related changes, uniform. The left kidney measured 3.63 cm.

Adrenal Glands

The regions of the **adrenal glands** revealed no evident pathology.

Spleen

The **spleen** presented a smooth homogeneous parenchyma hyperechoic to liver and renal cortical parenchyma. The capsule was smooth without noticeable expansion or deviation from within the spleen or adjacent pathology. The splenic vasculature demonstrated normal volume without signs of congestion or thrombosis. No sonographic evidence of acute or chronic inflammatory, neoplastic, or infarctual changes were noted.

Liver

The **liver** images submitted revealed subjectively normal liver size, contour, and structure. Parenchymal echogenicity was naturally coarse and hypoechoic to the spleen. Vascular and biliary tracts were of normal volume with no evidence of congestion. The gallbladder presented acceptably thin walls with primarily anechoic content. The cystic and common bile ducts were normal. No pathological hepatic lymphadenopathy was evident. No overt structural evidence of inflammatory, infiltrative or regenerative pathology was evident.

Gastrointestinal

The **stomach** itself was unremarkable. A separate intestinal mass was also noted, measuring approximately 8.0 cm. The remainder of the GI tract was unremarkable.

Pancreas

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

Free Abdomen

Echogenic **free fluid** was noted throughout the abdomen. Echogenic and nodular omentum was noted throughout the mid abdomen.

ULTRASONOGRAPHIC FINDINGS

PATIENT

Ghost Dooley

- Intestinal and right renal neoplasia with echogenic free fluid, consistent with lymphomatosis or similar neoplasia

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

SPECIES

Feline

FNA of the masses and immediate chemotherapy could be considered. However, this is an extensive pathology and humane euthanasia should be considered.
