

**PATIENT**

**PRESENTING CLINICAL SIGNS**

Boo Steinheimer

Hypersalivation.

**SPECIES**

**ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN**

Canine

**Urinary System**

**BREED**

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes was noted. Ureteral papillae were normal.

Weimaraner

**SEX**

The **kidneys** revealed normal size and structure, corticomedullary definition and ratio for this age. The cortices presented largely uniform texture with normal echogenic relationship to liver and spleen. Medullary structure differed distinctly from the cortex and no evidence of pelvic dilation was present. The capsules were acceptably uniform without significant irregularities. The left kidney measured 7.5 cm.

Neutered male

**AGE**

5 years

**INTERPRETED BY**

**Adrenal Glands**

Eric Lindquist, DMV  
DABVP, Cert. IVUSS

Both **adrenal glands** were visualized and recognized as having normal shape, size, position and echogenicity for this breed. The phrenic vasculature, glandular echogenicity and detail were unremarkable. Capsule, cortex, and medullary definition were normal for this age patient. The left adrenal gland measured 2.5 x 0.6 cm. The right adrenal gland measured 2.0 x 0.5 cm.

**IMAGING PERFORMED BY**

Eric Lindquist, DMV  
DABVP, Cert. IVUSS

**Spleen**

**HOSPITAL NAME**

The **spleen** presented a smooth homogeneous parenchyma hyperechoic to liver and renal cortical parenchyma. The capsule was smooth without noticeable expansion or deviation from within the spleen or adjacent pathology. The splenic vasculature demonstrated normal volume without signs of congestion or thrombosis. No sonographic evidence of acute or chronic inflammatory, neoplastic, or infarctual changes was noted.

Rockaway AH

**REFERRING VET**

Dr. Maniar

**Liver**

**INVOICE**

The **liver** images submitted revealed subjectively normal liver size, contour, and structure. Parenchymal echogenicity was naturally coarse and hypoechoic to the spleen. Vascular and biliary tracts were of normal volume with no evidence of congestion. The gallbladder presented acceptably thin walls with primarily anechoic content. The cystic and common bile ducts were normal. No pathological hepatic lymphadenopathy was evident. No overt structural evidence of inflammatory, infiltrative or regenerative pathology was evident.

**DATE**

8/20/21

**PATIENT**

**Gastrointestinal**

Boo Steinheimer

The **gastrointestinal tract** was largely normal except for a 1.7 cm shadowing structure in the pyloric outflow. This is non-obstructive and consistent with woodchip or similar.

**SPECIES**

Canine

**Pancreas**

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

**BREED**

Weimaraner

**SEX**

Neutered male

**ULTRASONOGRAPHIC FINDINGS**

Woodchip type foreign structure in the pyloric outflow.

**AGE**

5 years

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

The woodchip is small enough to break down and pass. I recommended conservative treatment. If clinical signs persist then an endoscopy is indicated. If surgery is performed recheck sonogram is recommended just prior to surgery to ensure that the structure is persistently present.
