

**PATIENT**

Peanut Butter Palmieri

**SPECIES**

Feline

**BREED**

DSH

**SEX**

Spayed Female

**AGE**

9 Years

**WEIGHT**

10.7 Pounds

**INTERPRETED BY**

Eric Lindquist, DMV  
DABVP, Cert. IVUSS

**IMAGING PERFORMED BY**

Jenn

**HOSPITAL NAME**

Rockaway AH

**REFERRING VET**

Dr. Maniar

**INVOICE**

17037

**DATE**

8/25/22

**PRESENTING CLINICAL SIGNS**

History: re check prev u/s on 8/23

**ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN**

**Urinary System**

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized, and anechoic urine was present. No evidence of inflammatory or neoplastic changes were noted. Ureteral papillae were normal.

The **kidneys** revealed normal size and structure, corticomedullary definition and ratio for this age. The cortices presented largely uniform texture with normal echogenic relationship to liver and spleen. Medullary structure differed distinctly from the cortex and no evidence of pelvic dilation was present. The capsules were acceptably uniform without significant irregularities. The left kidney measured 4.0 cm. The right kidney measured 4.0 cm.

**Adrenal Glands**

The regions of the **adrenal glands** revealed no evident pathology.

**Spleen**

The **spleen** revealed slight scalloping contour yet improved compared to the prior sonogram.

**Liver**

The **liver** was diffusely hyperechoic. The gallbladder was overdistended with echogenic debris and thickened wall, mildly improved compared to the prior sonogram. The cystic duct was tortuous.

**Gastrointestinal**

Examination of the **gastrointestinal tract** revealed a stomach and intestine free of stasis, of normal wall thickness, acceptable curvilinear mural detail, and peristaltic activity. Small and large intestine demonstrated normal luminal chyme and stool consistency respectively. No obstructive or overt infiltrative disease was noted. No associated abnormal lymphatic activity was noted.

**Pancreas**

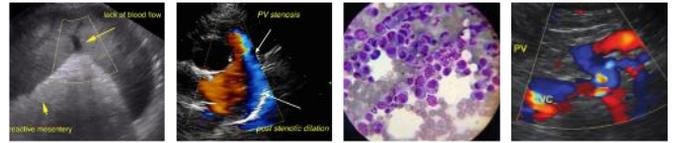

The **pancreas** was persistently inflamed, hypoechoic and mildly irregular, yet mildly improved compared to the prior sonogram.

**ULTRASONOGRAPHIC FINDINGS**

- Persistent resolving pancreatitis
- Liver diffusely hyperechoic
- Gallbladder, overdistended with echogenic debris and thickened wall, mildly improved compared to the prior sonogram
- Spleen, slight scalloping contour, improved compared to the prior sonogram

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

Continuation of therapy for pancreatitis/cholangitis is recommended. The choice to treat as an

**PATIENT**

outpatient would be based on clinical status. The possibility of neoplasia is minimal.
