

**PATIENT**

Truffle Roarty

**PRESENTING CLINICAL SIGNS**

History: re check prev u/s 8/23 showed soft shadowing gastric material

**SPECIES**

Canine

**ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN**

**Urinary System**

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized, and anechoic urine was present. No evidence of inflammatory or neoplastic changes were noted. Ureteral papillae were normal.

**BREED**

Portuguese Water Dog

The **kidneys** revealed normal size and structure, corticomedullary definition and ratio for this age. The cortices presented largely uniform texture with normal echogenic relationship to liver and spleen. Medullary structure differed distinctly from the cortex and no evidence of pelvic dilation was present. The capsules were acceptably uniform without significant irregularities. The right kidney measured 5.55 cm. The left kidney measured 5.56 cm.

**SEX**

Female

**AGE**

6 Years

**Adrenal Glands**

Both **adrenal glands** were visualized and recognized as having normal shape, size, position and echogenicity for this breed. The phrenic vasculature, glandular echogenicity and detail were unremarkable. Capsule, cortex, and medullary definition were normal for this age patient. The left adrenal gland measured 2.07 cm x 0.49 cm at the caudal pole and 0.65 cm at the cranial pole. The right adrenal gland measured 0.6 cm.

**WEIGHT**

52 Pounds

**Spleen**

The **spleen** presented a smooth homogeneous parenchyma hyperechoic to liver and renal cortical parenchyma. The capsule was smooth without noticeable expansion or deviation from within the spleen or adjacent pathology. The splenic vasculature demonstrated normal volume without signs of congestion or thrombosis. No sonographic evidence of acute or chronic inflammatory, neoplastic, or infarctual changes were noted.

**INTERPRETED BY**

Eric Lindquist, DMV  
DABVP, Cert. IVUSS

**IMAGING PERFORMED BY**

Jenn

**Liver**

The **liver** images submitted revealed subjectively normal liver size, contour, and structure. Parenchymal echogenicity was naturally coarse and hypoechoic to the spleen. Vascular and biliary tracts were of normal volume with no evidence of congestion. The gallbladder presented acceptably thin walls with primarily anechoic content. The cystic and common bile ducts were normal. No pathological hepatic lymphadenopathy was evident. No overt structural evidence of inflammatory, infiltrative or regenerative pathology was evident.

**HOSPITAL NAME**

Rockaway AH

**REFERRING VET**

Dr. Maniar

**Gastrointestinal**

The **stomach** revealed persistent soft shadowing luminal material. If the patient was not NPO, this could represent ingesta or grass, nonobstructive at this time. However, grass and soft foreign matter are also possible. The small intestine and colon were unremarkable.

**INVOICE**

17035

**Pancreas**

**DATE**

8/25/22

**PATIENT**

Truffle Roarty

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

**SPECIES**

Canine

**ULTRASONOGRAPHIC FINDINGS**

- Soft shadowing gastric luminal material, grass or similar suspected or retention of ingesta

**BREED**

Portuguese Water Dog

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

If the patient was NPO and clinical for upper GI irritation, then gastrotomy is indicated or endoscopy could be considered.
