

PATIENT

Ruby Malcom

PRESENTING CLINICAL SIGNS

Had tapeworms persistent diarrhea

SPECIES

Feline

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The **urinary bladder** presented a minimal amount of urine with echogenic debris.

BREED

DSH

The **kidneys** revealed significantly dysplastic architecture with loss of corticomedullary definition and disrupted pelvises with mineralization. The right kidney measured 3.11 cm. The left kidney measured 2.39 cm.

SEX

Female

Adrenal Glands

The regions of the adrenal glands were unremarkable.

Spleen

AGE

7 Months

The **spleen** presented a smooth homogeneous parenchyma hyperechoic to liver and renal cortical parenchyma. The capsule was smooth without noticeable expansion or deviation from within the spleen or adjacent pathology. The splenic vasculature demonstrated normal volume without signs of congestion or thrombosis. No sonographic evidence of acute or chronic inflammatory, neoplastic, or infarctual changes were noted.

WEIGHT

7

Liver

The **liver** images submitted revealed subjectively normal liver size, contour, and structure. Parenchymal echogenicity was naturally coarse and hypoechoic to the spleen. Vascular and biliary tracts were of normal volume with no evidence of congestion. The gallbladder presented acceptably thin walls with primarily anechoic content. The cystic and common bile ducts were normal. No pathological hepatic lymphadenopathy was evident. No overt structural evidence of inflammatory, infiltrative or regenerative pathology was evident.

INTERPRETED BY

Eric Lindquist, DMV
DABVP, Cert. IVUSS

IMAGING PERFORMED BY

Jenn

Gastrointestinal

Examination of the **gastrointestinal tract** revealed a stomach and intestine free of stasis, of normal wall thickness, acceptable curvilinear mural detail, and peristaltic activity. Small and large intestine demonstrated normal luminal chyme and stool consistency respectively. No obstructive or overt infiltrative disease was noted. Reactive mesenteric lymph nodes noted.

HOSPITAL NAME

Rockaway AH

Pancreas

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

Dr. Maniar

ULTRASONOGRAPHIC FINDINGS

INVOICE

24963

- Bilaterally dysplastic kidneys – suspect congenital dysplasia with secondary degenerative changes given the age of the patient.
- Structurally unremarkable abdomen otherwise

DATE

8/26/21

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Renal values should be monitored carefully.
