

PATIENT

Sadie Amlevereau

PRESENTING CLINICAL SIGNS

Anorexic, depressed, PU/PD, mild vomiting.

Creatinine 2.8, increased BUN 114, AST 209, decreased platelets 151. Urine specific gravity 1.010

SPECIES

Canine

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

BREED

Labradoodle

Urinary System

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes was noted. Ureteral papillae were normal.

SEX

Female

The uterus was uniform and measured 0.5 cm. The lumen was empty.

AGE

10 months

The **kidneys** revealed normal size and structure, corticomedullary definition and ratio for this age. The cortices presented largely uniform texture with normal echogenic relationship to liver and spleen. Medullary structure differed distinctly from the cortex and no evidence of pelvic dilation was present. The capsules were acceptably uniform without significant irregularities. The left kidney measured 6.73 cm. The right kidney measured 6.34 cm.

INTERPRETED BY

Eric Lindquist, DMV
DABVP, Cert. IVUSS

Adrenal Glands

Both **adrenal glands** were visualized and recognized as having normal shape, size, position and echogenicity for this breed. The phrenic vasculature, glandular echogenicity and detail were unremarkable. Capsule, cortex, and medullary definition were normal for this age patient. The left adrenal gland measured 2.45 x 0.44 cm. The right adrenal gland measured 2.45 x 1.68 cm at the cranial pole and 0.67 cm at the caudal pole.

IMAGING PERFORMED BY

Eric Lindquist, DMV
DABVP, Cert. IVUSS

HOSPITAL NAME

Andover AH

Spleen

The **spleen** presented a smooth homogeneous parenchyma hyperechoic to liver and renal cortical parenchyma. The capsule was smooth without noticeable expansion or deviation from within the spleen or adjacent pathology. The splenic vasculature demonstrated normal volume without signs of congestion or thrombosis. No sonographic evidence of acute or chronic inflammatory, neoplastic, or infarctual changes was noted.

Liver

The **liver** images submitted revealed subjectively normal liver size, contour, and structure. Parenchymal echogenicity was naturally coarse and hypoechoic to the spleen. Vascular and biliary tracts were of normal volume with no evidence of congestion. The gallbladder presented acceptably thin walls with primarily anechoic content. The cystic and common bile ducts were normal. No pathological hepatic lymphadenopathy was evident. No overt structural evidence of inflammatory, infiltrative or regenerative pathology was evident.

DATE

8/27/21

PATIENT

Gastrointestinal

Sadie Amlevereau

The **stomach** revealed minor retention of ingesta with normal transit of chyme. The gastrointestinal tract was unremarkable. The curvilinear patterns were normal. There was no evidence of obstruction.

SPECIES

Canine

Pancreas

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

BREED

Labradoodle

SEX

Female

ULTRASONOGRAPHIC FINDINGS

Structurally normal abdomen.

Acute renal insult is suspected.

AGE

10 months

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Leptospirosis, Addison's and renal toxin are all possible. There was no evidence of structural disease.
