

**PATIENT** **PRESENTING CLINICAL SIGNS**

Datsun Torres

History: ate a sock a few days ago, vomiting since then. Did not defecate yesterday. Dehydrated, lethargic. Abdomen not painful. P started on Cerenia IV and IV fluids

**SPECIES**

Abnormal PE/Chem/CBC/UA Results: See attached labs: mild hemoconcentration, low K+ and Cl-. See attached rads: moderately dilated stomach, possible soft FB in intestines?

Canine

**ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN**

**BREED**

**Urinary System**

Siberian Husky

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes was noted. Ureteral papillae were normal.

**SEX**

Intact male

**AGE**

9 years

The **kidneys** revealed normal size and structure, corticomedullary definition and ratio for this age. The cortices presented largely uniform texture with normal echogenic relationship to liver and spleen. Medullary structure differed distinctly from the cortex and no evidence of pelvic dilation was present. The capsules were acceptably uniform without significant irregularities. The left kidney measured 6.3 cm. The right kidney measured 7.1 cm.

**WEIGHT**

57 lbs

**Adrenal Glands**

**INTERPRETED BY**

Eric Lindquist, DMV  
DABVP, Cert. IVUSS

Both **adrenal glands** were visualized and recognized as having normal shape, size, position and echogenicity for this breed. The phrenic vasculature, glandular echogenicity and detail were unremarkable. Capsule, cortex, and medullary definition were normal for this age patient.

**IMAGING PERFORMED BY**

Jasmine Palacios

**Spleen**

The **spleen** presented a smooth homogeneous parenchyma hyperechoic to liver and renal cortical parenchyma. The capsule was smooth without noticeable expansion or deviation from within the spleen or adjacent pathology. The splenic vasculature demonstrated normal volume without signs of congestion or thrombosis. No sonographic evidence of acute or chronic inflammatory, neoplastic, or infarctual changes was noted.

**HOSPITAL NAME**

Rivers Edge Pet  
Medical Center

**Liver**

**REFERRING VET**

Dr. Hayes

The **liver** images submitted revealed subjectively normal liver size, contour, and structure. Parenchymal echogenicity was naturally coarse and hypoechoic to the spleen. Vascular and biliary tracts were of normal volume with no evidence of congestion. The gallbladder presented acceptably thin walls with primarily anechoic content. The cystic and common bile ducts were normal. No pathological hepatic lymphadenopathy was evident. No overt structural evidence of inflammatory, infiltrative or regenerative pathology was evident.

**DATE**

8/4/23

**PATIENT**

Datsun Torres

**Gastrointestinal**

The stomach was over distended with fluid. Gastric over distension reached the gastroesophageal inlet. Linear foreign body attachment was noted from the pylorus to the duodenum. This is consistent with fabric foreign body and continued into the jejunum.

**SPECIES**

Canine

**Pancreas**

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

**BREED**

Siberian Husky

**SEX**

Intact male

**ULTRASONOGRAPHIC FINDINGS**

Gastrointestinal fabric/linear foreign body.

**AGE**

9 years

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

Immediate exploratory surgery is indicated.
