

PATIENT

Coco Bisch

PRESENTING CLINICAL SIGNS

History: recheck scan showed shadowing gastric foreign matter Also splenic lesion was noted in 1st scan from 8/2 but not 8/8, is it still there

SPECIES

Canine

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

BREED

Jack Russell

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes was noted. Ureteral papillae were normal.

SEX

Spayed female

The **kidneys** revealed largely normal size and structure, corticomedullary definition and ratio (cortex 1/3 of medulla) were essentially maintained with some age-related loss of curvilinear patterns regarding the capsule and C/M junction. The cortices presented largely uniform texture with some increased echogenicity expected for his age patient. Medullary structure differed distinctly from that of the cortex and no evidence of pelvic dilation was present. The changes in the kidneys are similar to the prior sonogram. Cortical infarcts were noted. The right kidney measured 4.26 cm.

AGE

15 years

WEIGHT

14.8 lbs

Adrenal Glands

Both **adrenal glands** were visualized and recognized as having normal shape, size, position and echogenicity for this breed. The phrenic vasculature, glandular echogenicity and detail were unremarkable. Capsule, cortex, and medullary definition were normal for this age patient. The right adrenal gland measured 1.44 x 1.3 cm at the cranial pole and 0.57 cm at the caudal pole. The left adrenal gland measured 1.63 x 0.56 cm at the caudal pole and 0.44 cm at the cranial pole.

INTERPRETED BY

Eric Lindquist, DMV
DABVP, Cert. IVUS

IMAGING PERFORMED BY

Jenn

Spleen

The **spleen** revealed subtle, heterogenous, parenchymal changes with an overt nodule at the mid cranial body measuring 1.24 cm. This was likely obscured by gastric artifact on the prior sonogram.

HOSPITAL NAME

Rockaway AH

Liver

The **liver** images submitted revealed subjectively normal liver size, contour, and structure. Parenchymal echogenicity was naturally coarse and hypoechoic to the spleen. Vascular and biliary tracts were of normal volume with no evidence of congestion. The gallbladder presented acceptably thin walls with primarily anechoic content. The cystic and common bile ducts were normal. No pathological hepatic lymphadenopathy was evident. No overt structural evidence of inflammatory, infiltrative or regenerative pathology was evident.

Gastrointestinal

The **stomach** was persistently filled with shadowing material. This is consistent with foreign body and measured 2.9 cm. The small intestines and colon were unremarkable.

SPECIES

Canine

Pancreas

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

BREED

Jack Russell

ULTRASONOGRAPHIC FINDINGS

SEX

Spayed female

Gastric foreign body.

Splenic nodule, benign cyst versus hemangiosarcoma.

AGE

15 years

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Gastrotomy and splenectomy is indicated. Chest radiographs are warranted prior to surgery to ensure that metastatic disease is not present.

WEIGHT
