

**PATIENT**

Jinks Suitt

**SPECIES**

Feline

**BREED**

Domestic Shorthair

**SEX**

Female

**AGE**

6 years

**WEIGHT**

19 lbs

**INTERPRETED BY**

Eric Lindquist, DMV  
DABVP, Cert. IVUSS

**IMAGING PERFORMED BY**

Jenn

**HOSPITAL NAME**

Rockaway AH

**REFERRING VET**

Dr. Kahn

**INVOICE**

32697

**DATE**

9/1/22

**PRESENTING CLINICAL SIGNS**

History: 3 day hx of anorexia no V/D  
Abnormal PE/Chem/CBC/UA Results: CBC WNL decreased CL with normal Na TP increased glob ALP !@@ GGT 5 FPL normal

**ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN**

**Urinary System**

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. Small calculi were noted in the bladder and measured up to 0.4 cm. The calculi were non-shadowing and therefore may be dissolvable. Urinary work-up is warranted. No evidence of inflammatory or neoplastic changes was noted. Ureteral papillae were normal.

The **kidneys** revealed normal size and structure, corticomedullary definition and ratio for this age. The cortices presented largely uniform texture with normal echogenic relationship to liver and spleen. Medullary structure differed distinctly from the cortex and no evidence of pelvic dilation was present. The capsules were acceptably uniform without significant irregularities. The right kidney measured 3.98 cm. The left kidney measured 3.94 cm.

**Adrenal Glands**

Both **adrenal glands** were visualized and recognized as having normal shape, size, position and echogenicity for this breed. The phrenic vasculature, glandular echogenicity and detail were unremarkable. Capsule, cortex, and medullary definition were normal for this age patient.

**Spleen**

The **spleen** presented a smooth homogeneous parenchyma hyperechoic to liver and renal cortical parenchyma. The capsule was smooth without noticeable expansion or deviation from within the spleen or adjacent pathology. The splenic vasculature demonstrated normal volume without signs of congestion or thrombosis. No sonographic evidence of acute or chronic inflammatory, neoplastic, or infarctual changes was noted.

**Liver**

The **liver** was diffusely hyperechoic to the falciform fat. The falciform fat is excessive in this patient. The gallbladder presented acceptably thin walls with primarily anechoic content. The cystic and common bile ducts were normal. No pathological hepatic lymphadenopathy was evident. No overt structural evidence of inflammatory, infiltrative or regenerative pathology was evident.

**Gastrointestinal**

Mild, soft shadowing **gastric** material was noted. This is consistent with hairball accumulation.

**PATIENT**

**Pancreas**

Jinks Suitt

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

**SPECIES**

Feline

**ULTRASONOGRAPHIC FINDINGS**

**BREED**

Small bladder calculi.

Domestic Shorthair

Hepatic lipodosis.

Hairball accumulation in the stomach.

**SEX**

Female

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

**AGE**

6 years

Urinary work up is warranted with medical management. Treatment for hairballs and supportive care is warranted. Other causes of anorexia such as pain related disease, thoracic and CNS disease should be considered.

**WEIGHT**
