

**PATIENT PRESENTING CLINICAL SIGNS**

Kaya Dishinger  
Increased liver values during wellness bloodwork with no clinical signs. Current meds: cranberry  
Abnormal PE/Chem/CBC/UA Results: ALT 1004, Alkp 166, GGTP 30, All else WNL

**SPECIES ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN**

Canine

**Urinary System**

**BREED**

Terrier X

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes were noted. Ureteral papillae were normal.

**SEX**

Spayed Female

The **kidneys** revealed normal size and structure, corticomedullary definition and ratio for this age. The cortices presented largely uniform texture with normal echogenic relationship to liver and spleen. Medullary structure differed distinctly from the cortex and no evidence of pelvic dilation was present. The capsules were acceptably uniform without significant irregularities. The left kidney measured 4.38 cm. The right kidney measured 4.74 cm.

**AGE**

9 Years

**Adrenal Glands**

**WEIGHT**

16.4 Pounds

Both **adrenal glands** were visualized and recognized as having normal shape, size, position and echogenicity for this breed. The phrenic vasculature, glandular echogenicity and detail were unremarkable. Capsule, cortex, and medullary definition were normal for this age patient. The left adrenal gland measured 1.83 cm x 0.58 cm at the caudal pole and 0.42 cm at the cranial pole. The right adrenal gland measured 1.62 cm x 0.42 cm at the caudal pole and 1.04 cm at the cranial pole.

**INTERPRETED BY**

Eric Lindquist, DMV  
DABVP, Cert. IVUSS

**Spleen**

The **spleen** presented a smooth homogeneous parenchyma hyperechoic to liver and renal cortical parenchyma. The capsule was smooth without noticeable expansion or deviation from within the spleen or adjacent pathology. The splenic vasculature demonstrated normal volume without signs of congestion or thrombosis. No sonographic evidence of acute or chronic inflammatory, neoplastic, or infarctual changes were noted.

**IMAGING PERFORMED BY**

Jessica Miller

**Liver**

**HOSPITAL NAME**

Dr. T VC

The **liver** presented slight increased portal markings, minor coarse architecture, and normal size. The gallbladder and common bile duct were unremarkable.

**Gastrointestinal**

**REFERRING VET**

Dr. Turk

Examination of the **gastrointestinal tract** revealed a stomach and intestine free of stasis, of normal wall thickness, acceptable curvilinear mural detail, and peristaltic activity. Small and large intestine demonstrated normal luminal chyme and stool consistency respectively. No obstructive or overt infiltrative disease was noted. No associated abnormal lymphatic activity was noted.

**INVOICE**

25422

**Pancreas**

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

**DATE**

9/15/21

**ULTRASONOGRAPHIC FINDINGS**

- Non-specific inflammatory hepatopathy, possible underlying Leptospirosis

**PATIENT**

Kaya Dishinger

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

Leptospirosis titers warranted with ultrasound guided FNA of the liver for further definition. Amoxicillin/Metronidazole and nutraceuticals indicated. No evidence of neoplasia.
