**Cardiac Presentation**

The echocardiogram in this patient demonstrated normal **left atrial** size based on 3 separate methods of LA evaluation. The cranial and caudal **mitral** valve leaflets presented normal linear structure, extension in systole, and union in diastole with normal kinesis. The **left ventricle** presented thicknesses with linear contour and was not dilated nor restricted. The **myocardium** presented normal echogenicity without subjective evidence of significant fibrotic or ischemic disease. **Contractility** of the ventricular walls was adequate and in normal range for this patient evidenced by the fractional shortening measurement and subjective evaluation of the different regions of the myocardium. The **left ventricular outflow** tract demonstrated normal laminar flow and subjective structural integrity. The **right atrium** and auricle revealed normal size, structure and content. No evidence of masses was noted. **Tricuspid** valvular assessment demonstrated adequate linear morphology and kinesis. The **right ventricle** was of normal size (1/3 diameter of LV), chordae structure, myocardial echogenicity and thickness. **Pulmonary outflow** tract assessment revealed normal valve structure, laminar flow, and diameter (approx.1:1 pa/ao ratio). No visible **pericardial** or free pleura fluid was noted. The cranial **mediastinum and pericardial and extra-cardiac regions** were free of masses in the visible window.

**INTERPRETED BY**

Eric Lindquist, DMV

**DATE**

9/22/22

**Urinary System**

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes were noted. Ureteral papillae were normal. The pelvic urethra was imaged 2.0 cm beyond the cystourethral junction.

The **kidneys** revealed largely normal size and structure, corticomedullary definition and ratio (cortex 1/3 of medulla) were essentially maintained with some age-related loss of curvilinear patterns regarding the capsule and C/M junction. The cortices presented largely uniform texture with some increased

**PATIENT**

Dutch Spivey

echogenicity expected for his age patient. Medullary structure differed distinctly from that of the cortex and no evidence of pelvic dilation was present. The right kidney measured 5.76 cm.

**Adrenal Glands**

**SPECIES**

Canine

Both **adrenal glands** were visualized and recognized as having normal shape, size, position and echogenicity for this breed. The phrenic vasculature, glandular echogenicity and detail were unremarkable. Capsule, cortex, and medullary definition were normal for this age patient. The right adrenal gland measured 2.89 cm x 1.16 cm at the cranial pole and 1.12 cm at the caudal pole.

**BREED**

Pit X

**Spleen**

The caudal pole of the **spleen** presented a 12 cm parenchymal mass. Mild amount of free fluid noted. The mass was pedunculated and attached to an approximate 5.0 mm portion of the spleen. The mass is highly precarious.

**SEX**

Neutered Male

**Liver**

The **liver** presented isoechoic micro- and macronodular changes, which may represent metastatic lesions or pronounced nodular hyperplasia. Increased portal markings noted. The gallbladder and common bile duct were unremarkable.

**AGE**

12 Years

**Gastrointestinal**

**WEIGHT**

81.5 Pounds

Examination of the **gastrointestinal tract** revealed a stomach and intestine free of stasis, of normal wall thickness, acceptable curvilinear mural detail, and peristaltic activity. Small and large intestine demonstrated normal luminal chyme and stool consistency respectively. No obstructive or overt infiltrative disease was noted. No associated abnormal lymphatic activity was noted.

**INTERPRETED BY**

Eric Lindquist, DMV

**Pancreas**

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

DABVP, Cert. IVUSS

**IMAGING PERFORMED BY**

Jenn

**ULTRASONOGRAPHIC FINDINGS**

- Normal echocardiogram
- Nodular hyperplasia liver pattern with remodeling
- Splenic mass – highly precarious, at risk for significant rupture, minor free fluid would suggest some hemorrhage.
- Age related renal changes

**HOSPITAL NAME**

Rockaway AH

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

**REFERRING VET**

Dr. Maniar

Potential for metastatic disease to the liver. However, the liver presentation would be more consistent with nodular hyperplasia and remodeling for unrelated issues. Chest radiographs and exploratory surgery indicated.
