PRESENTING CLINICAL SIGNS

Owner woke up to patient crying in pain and vomiting, had a bloated stomach the other day Hx of diabetes

SPECIES

Canine

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

BREED

DSH

The urinary bladder, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes were noted. Ureteral papillae were normal.

SEX

MN

The kidneys revealed largely normal size and structure, corticomedullary definition and ratio (cortex 1/3 of medulla) were essentially maintained with some moderate age-related loss of curvilinear patterns regarding the capsule and C/M junction. The cortices presented largely uniform texture with some increased echogenicity expected for his age patient. Medullary structure differed distinctly from that of the cortex and no evidence of pelvic dilation was present. The left kidney measured 4.46 cm in length. The right kidney measured 4.15 cm in length.

AGE

19

Adrenal Glands

WEIGHT

17

The area of the left and right adrenal glands was free of pathology.

Spleen

INTERPRETED BY

Eric Lindquist, DMV
DABVP, Cert. IVUSS

The spleen presented a smooth homogeneous parenchyma hyperechoic to liver and renal cortical parenchyma. The capsule was smooth without noticeable expansion or deviation from within the spleen or adjacent pathology. The splenic vasculature demonstrated normal volume without signs of congestion or thrombosis. No sonographic evidence of acute or chronic inflammatory, neoplastic, or infarctual changes were noted.

Liver

IMAGING PERFORMED BY

Jenn

The liver images from right and left intercostal as well as subcostal views revealed subjectively normal liver size, contour, and structure. Some minor age-related parenchymal remodeling was noted but likely not clinically significant at this time. Vascular and biliary tracts were of normal volume and no evidence of congestion was noted. The gallbladder presented some dependent debris with essentially normal contour. The cystic and common bile ducts were normal. No overt evidence of active inflammatory, infiltrative or regenerative pathology was noted but should be paired with current or past LE elevations regarding any clinical significance to this presentation. The hepatic lymph nodes were unremarkable. T

Gastrointestinal

REFERRING VET

Dr. Maniar

Examination of the gastrointestinal tract revealed a stomach and intestine free of stasis, of normal wall thickness, acceptable curvilinear mural detail, and peristaltic activity. Small and large intestine demonstrated normal luminal chyme and stool consistency respectively. No obstructive or overt infiltrative disease was noted. No associated abnormal lymphatic activity was noted.

INVOICE

11711ag

Pancreas

DATE

The pancreas revealed a large polycystic structure consistent with pancreatic pseudocyst. The structure created a mass effect of ~ 6.0 cm of echogenic debris.

PATIENT

Free Abdomen

Till Myers

No omental masses, overt lymphadenopathy or peritoneal free fluid present.

SPECIES

Canine

ULTRASONOGRAPHIC FINDINGS

- Pancreatic cyst with echogenic debris-possible abscessation
- Otherwise, a geriatric abdomen

BREED

DSH

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

SEX

Ultrasound guided drainage of the polycystic pancreatic structure with C/S and cytology is recommended. No evidence of neoplasia was observed.
