

PATIENT

Maggie LVH

SPECIES

Feline

BREED

DSH

SEX

Spayed Female

AGE

8 Years

WEIGHT

5.9 kg

INTERPRETED BY

Eric Lindquist, DMV
DABVP, Cert. IVUSS

IMAGING PERFORMED BY

Dr. Hayley Biederbeck

HOSPITAL NAME

Lomsnes Vet Hospital

REFERRING VET

Dr. Hayley Biederbeck

INVOICE

25998

DATE

9/30/21

PRESENTING CLINICAL SIGNS

****Clinic cat!! Surrendered to clinic for soft stools and has become our clinic cat. chronic soft small bm ~ 2-3x/day vomits liquid/food ~ 2x/week energy/appetite good, no weight loss current diet Hills biome kibble 1/3c BID current meds: prednisolone 1.25mg PO SID Transitioning onto Hydrolyzed diet now as Biome not seeming to work
Abnormal PE/Chem/CBC/UA Results: All labwork normal.

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes were noted. Ureteral papillae were normal.

The **kidneys** revealed largely normal size and structure, corticomedullary definition and ratio (cortex 1/3 of medulla) were essentially maintained with some age-related loss of curvilinear patterns regarding the capsule and C/M junction. The cortices presented largely uniform texture with some increased echogenicity expected for his age patient. Medullary structure differed distinctly from that of the cortex and no evidence of pelvic dilation was present. The kidneys measured 3.0 cm each.

Adrenal Glands

The regions of the **adrenal glands** were unremarkable.

Spleen

The **spleen** was mildly enlarged at approximately 1.0 cm with subtle micronodular changes. The spleen was folded upon itself caudally.

Liver

The **liver** itself appeared unremarkable. The gallbladder wall was mildly thickened and edematous. History of cholangitis likely.

Gastrointestinal

Minor retention of ingesta noted in the **stomach**. The small intestine and colon were unremarkable.

Pancreas

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

ULTRASONOGRAPHIC FINDINGS

- Unremarkable abdomen with mild hepatic remodeling and splenic enlargement

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

If weight loss is an issue, FNA of the spleen would be indicated. However, this may be a simple reactive state. The Prednisone may be suppressing a more significant presentation.
