PRESENTING CLINICAL SIGNS

History: Chashews is a feline chinchilla 8 months old, male, entire. He was presented yesterday for profuse Watery diarrhea and for fecal incontinence, defecating out of the litter tray, since yesterday. However still eating well. Not interacting as usual with the family. The cat is fully vaccinated, also on RC diet only, indoor. At the clinical presentation Bar, quite anxious. HR 138 RR 38. The heart and lung auscultation do not reveals abnormalities. Pulse is full. The abdominal palpation does not reveal discomfort or findings. Temp is 39.1. The CBC reveals mild decreased MPV, and increased RBC. The comprehensive reveals normal parameters. A/G ratio normal.

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The pelvic urethra was imaged 1.0 cm beyond the cystourethral junction and appeared normal. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes was noted. Ureteral papillae were normal.

The **kidneys** revealed normal size and structure, corticomedullary definition and ratio for this age. The cortices presented largely uniform texture with normal echogenic relationship to liver and spleen. Medullary structure differed distinctly from the cortex and no evidence of pelvic dilation was present. The capsules were acceptably uniform without significant irregularities. The right kidney measured 3.0 cm. The left kidney measured 3.0 cm.

Adrenal Glands

The **adrenal glands** were not visualized.

Spleen

The **spleen** presented a smooth homogeneous parenchyma hyperechoic to liver and renal cortical parenchyma. The capsule was smooth without noticeable expansion or deviation from within the spleen or adjacent pathology. The splenic vasculature demonstrated normal volume without signs of congestion or thrombosis. No sonographic evidence of acute or chronic inflammatory, neoplastic, or infarctual changes was noted.

Liver

The **liver** images submitted revealed subjectively normal liver size, contour, and structure. Parenchymal echogenicity was naturally coarse and hypoechoic to the spleen. Vascular and biliary tracts were of normal volume with no evidence of congestion. The gallbladder presented acceptably thin walls with primarily anechoic content. The cystic and common bile ducts were normal. No pathological hepatic lymphadenopathy was evident. No overt structural evidence of inflammatory, infiltrative or regenerative pathology was evident.

PATIENT

Gastrointestinal

Cashew Al Janahi

The visible **gastrointestinal tract** was unremarkable. The mesenteric lymph nodes were reactive and measured up to 0.4 cm.

SPECIES

Feline

Pancreas

BREED

Chinchilla

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

SEX

Spayed female

ULTRASONOGRAPHIC FINDINGS

Structurally unremarkable abdomen.

AGE

8 months

Reactive mesenteric lymph node.

WEIGHT

3.34 kg

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Occult parasitism, dietary intolerance and dietary indiscretion are all potentials.
