PRESENTING CLINICAL SIGNS

History: Cutaneous MCT removed 8/23 from L lateral trunk/abdomen. Clean narrow margins. Checking for metastasis prior to knee surgery.

Abnormal PE/Chem/CBC/UA Results: PE: healing skin incision on L lateral abdomen. Histopath of mass: Grade 2 MCT. Mitotic count 2/10 HPF. CBC/Chem: WNL. HW4Dx: Lyme +.

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized, and anechoic urine was present. No evidence of inflammatory or neoplastic changes were noted. Ureteral papillae were normal.

The **kidneys** revealed normal size and structure, corticomedullary definition and ratio for this age. The cortices presented largely uniform texture with normal echogenic relationship to liver and spleen. Medullary structure differed distinctly from the cortex and no evidence of pelvic dilation was present. The capsules were acceptably uniform without significant irregularities. The right kidney measured 4.32 cm. The left kidney measured 4.4 cm.

Adrenal Glands

The **left adrenal gland** was subnormal in size, measuring 0.3 cm.

The **right adrenal gland** was flattened, isoechoic and subnormal in size, measuring 4.0 mm.

Spleen

The **spleen** was uniform. Cranial folding of the spleen was noted.

Liver

The **liver** images submitted revealed subjectively normal liver size, contour, and structure. Parenchymal echogenicity was naturally coarse and hypoechoic to the spleen. Vascular and biliary tracts were of normal volume with no evidence of congestion. The gallbladder presented acceptably thin walls with primarily anechoic content. The cystic and common bile ducts were normal. No pathological hepatic lymphadenopathy was evident. No overt structural evidence of inflammatory, infiltrative or regenerative pathology was evident.

Gastrointestinal

There was some residual chyme and gas was noted in the **stomach**, yet not pathological. This is consistent with end post prandial presentation. Transit of chyme into the small intestine was normal. Curvilinear patterns were maintained throughout the GI tract. No evidence of pathology. Small and large intestine demonstrated normal luminal chyme and stool consistency respectively. No obstructive or overt infiltrative disease was noted. No associated abnormal lymphatic activity was noted.

Pancreas

PATIENT

Rosie Desrochers

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

SPECIES

Canine

ULTRASONOGRAPHIC FINDINGS

- Flattened adrenal glands, subnormal in size
- Splenic fold

BREED

French Bulldog

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Regarding the adrenal glands, the changes would be normal if the patient is receiving prednisone therapy, however, if no cortisone therapy is present in this patients history, then baseline cortisol or ACTH stimulation would be indicated to rule out underlying subclinical Addisons.
