

PATIENT

Bear Schwartz

PRESENTING CLINICAL SIGNS

hx of thyroid dz severe IBD vomiting intermittently, hairballs

SPECIES

Feline

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes were noted. Ureteral papillae were normal.

BREED

DSH

SEX

Neutered Male

The **kidneys** revealed largely normal size and structure, corticomedullary definition and ratio (cortex 1/3 of medulla) were essentially maintained with some age-related loss of curvilinear patterns regarding the capsule and C/M junction. The cortices presented largely uniform texture with some increased echogenicity expected for his age patient. Medullary structure differed distinctly from that of the cortex and no evidence of pelvic dilation was present. Slight pinpoint mineralizations. The right kidney measured 4.23 cm. The left kidney measured 3.56 cm.

AGE

14 Years

Adrenal Glands

The regions of the **adrenal glands** were unremarkable.

WEIGHT

9

Spleen

The **spleen** presented a smooth homogeneous parenchyma hyperechoic to liver and renal cortical parenchyma. The capsule was smooth without noticeable expansion or deviation from within the spleen or adjacent pathology. The splenic vasculature demonstrated normal volume without signs of congestion or thrombosis. No sonographic evidence of acute or chronic inflammatory, neoplastic, or infarctual changes were noted.

INTERPRETED BY

Eric Lindquist, DMV
DABVP, Cert. IVUSS

Liver

The **liver** was mildly hyperechoic to falciform fat. The gallbladder and common bile duct were unremarkable.

IMAGING PERFORMED BY

Jenn

Gastrointestinal

The **stomach** was filled with progressively shadowing material, suspect hairball accumulation or post-prandial presentation. The small intestine and colon were unremarkable.

HOSPITAL NAME

Rockaway AH

Pancreas

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

REFERRING VET

Dr. Maniar

ULTRASONOGRAPHIC FINDINGS

- Geriatric abdomen with probable hairball accumulation in the stomach

INVOICE
