

PATIENT

Tucker Myslinski

PRESENTING CLINICAL SIGNS

History: recheck from yesterday has vomited a couple more times just bile and brown material

SPECIES

Canine

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

BREED

Chihuahua Mix

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes was noted. Ureteral papillae were normal.

SEX

Neutered male

The **kidneys** revealed normal size and structure, corticomedullary definition and ratio for this age. The cortices presented largely uniform texture with normal echogenic relationship to liver and spleen. Medullary structure differed distinctly from the cortex and no evidence of pelvic dilation was present. The capsules were acceptably uniform without significant irregularities. The left kidney measured 4.48 cm. The right kidney measured 4.85 cm.

AGE

9 years

WEIGHT

20 lbs

Adrenal Glands

Both **adrenal glands** were visualized and recognized as having normal shape, size, position and echogenicity for this breed. The phrenic vasculature, glandular echogenicity and detail were unremarkable. Capsule, cortex, and medullary definition were normal for this age patient. The left adrenal gland measured 1.65 x 0.64 cm at the caudal pole and 0.49 cm at the cranial pole. The right adrenal gland measured 1.8 x 0.63 cm at the caudal pole and 0.83 cm at the cranial pole.

INTERPRETED BY

Eric Lindquist, DMV
DABVP, Cert. IVUSS

Spleen

The **spleen** presented a smooth homogeneous parenchyma hyperechoic to liver and renal cortical parenchyma. The capsule was smooth without noticeable expansion or deviation from within the spleen or adjacent pathology. The splenic vasculature demonstrated normal volume without signs of congestion or thrombosis. No sonographic evidence of acute or chronic inflammatory, neoplastic, or infarctual changes was noted.

IMAGING PERFORMED BY

HOSPITAL NAME

Rockaway AH

Liver

The **liver** images submitted revealed subjectively normal liver size, contour, and structure. Parenchymal echogenicity was naturally coarse and hypoechoic to the spleen. Vascular and biliary tracts were of normal volume with no evidence of congestion. The gallbladder presented acceptably thin walls with primarily anechoic content. The cystic and common bile ducts were normal. No pathological hepatic lymphadenopathy was evident. No overt structural evidence of inflammatory, infiltrative or regenerative pathology was evident.

PATIENT

Tucker Myslinski

Gastrointestinal

The **stomach** was empty. The stasis pattern noted on the prior sonogram has resolved. The gastric wall was mildly hypertrophied with a minor amount of luminal fluid. The small intestine was empty. The colon revealed hard stool. Foreign body passage into the colon is entirely possible in this patient. I recommend monitoring of stool to assess for any passing foreign matter.

SPECIES

Canine

Pancreas

BREED

Chihuahua Mix

The **pancreas** is slightly heterogenous compared to the prior sonogram. Some level of low-grade pancreatitis is likely.

SEX

Neutered male

ULTRASONOGRAPHIC FINDINGS

Minor gastritis, pancreatitis pattern, appears to be resolving. No further obstructive pattern was noted.

AGE

9 years

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

I recommend medical management for gastritis.
