

PATIENT PRESENTING CLINICAL SIGNS

Nala Cox History: Weight loss, large mass along right side of the trachea.

SPECIES ULTRASONOGRAPHIC EXAMINATION OF THE THYROID

Canine The right thyroid region revealed a 2.0 x 3.0 cm mineralizing and irregularly expansive mass. The mass appears to be fairly encapsulated, however, the irregular contour is concerning regarding resectability. The mass expands upon regional structures while remaining encapsulated. The mass deviated the esophagus and impinges upon the trachea. This appears localized to the right thyroid region. The mass is moderately vascular. The left thyroid lobe appeared normal at 0.5 cm.

BREED

Goldendoodle

SEX ULTRASONOGRAPHIC FINDINGS

Spayed Female Right thyroid lobar mass, potentially resectable.

AGE

12 years

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

CT for surgical planning would be ideal or direct exploratory surgery. However, expansion into regional tissues is a concern. There is a minimal potential that hyperthyroidism is a paraneoplastic effect; therefore, full thyroid evaluation is recommended. Chest radiographs are also warranted to assess for metastatic disease.
