

## PATIENT

Chai Chung

## SPECIES

Feline

## BREED

Siamese Mix

## SEX

Spayed female

## AGE

13 years

## WEIGHT

3.8 kg

## INTERPRETED BY

Eric Lindquist, DMV,  
DABVP (CFM), Cert.  
IVUSS, CEO of  
SonoPath.com

## IMAGING PERFORMED BY

Vincent Ravancho

## HOSPITAL NAME

Bond Vet Edgewater

## REFERRING VET

Dr. Ordonez

## INVOICE

69613

## DATE

12/29/25

## PRESENTING CLINICAL SIGNS

History: V+ episodes. O reports increase water intake for approx. 2-3 times per day. O noticed V+ has increased over last 6 months to nearly everyday.

Abnormal PE/Chem/CBC/UA Results: BW unremarkable

## ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

### *Urinary System*

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The pelvic urethra was imaged 2.0 cm beyond the cystourethral junction and appeared normal. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes was noted. Ureteral papillae were normal.

The **kidneys** revealed largely normal size and structure, corticomedullary definition and ratio (cortex 1/3 of medulla) were essentially maintained with some age-related loss of curvilinear patterns regarding the capsule and C/M junction. The cortices presented largely uniform texture with some increased echogenicity expected for this age patient. Medullary structure differed distinctly from that of the cortex and no evidence of pelvic dilation was present. The left kidney measured 3.01 cm. The right kidney measured 2.9 cm.

The iliac trifurcation was unremarkable.

### *Adrenal Glands*

Both **adrenal glands** were visualized and recognized as having normal shape, size, position and echogenicity for this breed. The phrenic vasculature, glandular echogenicity and detail were unremarkable. Capsule, cortex, and medullary definition were normal for this age patient. The right adrenal gland measured 0.37 cm. The left adrenal gland measured 0.36 cm.

### *Spleen*

The **spleen** presented a smooth homogeneous parenchyma hyperechoic to liver and renal cortical parenchyma. The capsule was smooth without noticeable expansion or deviation from within the spleen or adjacent pathology. The splenic vasculature demonstrated normal volume without signs of congestion or thrombosis. No sonographic evidence of acute or chronic inflammatory, neoplastic, or infarctual changes was noted.

### *Liver*

The **liver** images submitted revealed subjectively normal liver size, contour, and structure. Parenchymal echogenicity was naturally coarse and hypoechoic to the spleen. Vascular and biliary tracts were of normal volume with no evidence of congestion. The gallbladder presented acceptably thin walls with primarily anechoic content. The cystic and common bile ducts were normal. No pathological hepatic

**PATIENT**

lymphadenopathy was evident. No overt structural evidence of inflammatory, infiltrative or regenerative pathology was evident.

Chai Chung

**SPECIES**

**Gastrointestinal**

Feline

The **gastrointestinal tract** revealed minor variable thickening and echogenic submucosal changes most consistent with low grade end result of chronic GI disease such as IBD and may be related to malassimilation of nutrients if any weight loss is present. No obvious neoplastic patterns were noted and luminal content as unremarkable.

**BREED**

Siamese Mix

**SEX**

**Pancreas**

Spayed female

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

**AGE**

13 years

**WEIGHT**

**ULTRASONOGRAPHIC FINDINGS**

3.8 kg

Geriatric abdomen with mild intestinal thickening, consistent with occult inflammatory bowel.

**INTERPRETED BY**

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

Eric Lindquist, DMV, DABVP (CFM), Cert. IVUSS, CEO of SonoPath.com

No neoplastic criteria was present. Full thickness gastrointestinal biopsies would be necessary for further definition from a surgical standpoint. Diet change to a hydrolyzed diet, parasite management and Prednisolone trial may be appropriate in this patient.
