PRESENTING CLINICAL SIGNS

- History of splenic mass, splenectomy 2/12/25. Spindle cell sarcoma grade 2
- Patient not eating, lethargic similar to previous episode when splenic mass diagnosed, 2/5/25
- Large mid Abdominal mass in rads.

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes was noted. Ureteral papillae were normal.

The **iliac trifurcation** was unremarkable.

The **kidneys** revealed largely normal size and structure, corticomedullary definition and ratio (cortex 1/3 of medulla) were essentially maintained with some age-related loss of curvilinear patterns regarding the capsule and C/M junction. The cortices presented largely uniform texture with some increased echogenicity expected for this age patient. Medullary structure differed distinctly from that of the cortex and no evidence of pelvic dilation was present. The left kidney measured 4.8 cm. The right kidney measured 5.5 cm.

Adrenal Glands

The left **adrenal gland** was enlarged, irregular and hypoechoic measuring 2.6 x 1.3 cm at the caudal pole and 0.72 cm at the cranial pole. Ill-defined margins are noted. There was no obvious evidence of vena cava invasion. The right adrenal gland was obscured by the hepatic pathology.

Spleen

The **spleen** was not visualized as it was previously removed. The splenic fossa was unremarkable.

Liver

The **liver** in this patient revealed a large, hypoechoic, sarcomatous type mass that was deriving from the caudal aspect of the left liver. The mass measured 7.8 cm. Multi-focal, hypoechoic target lesions and masses are noted throughout the liver. This is strongly consistent with metastatic disease. Generalized hepatomegaly was present. The gallbladder was unremarkable. The hepatic lymph nodes were enlarged, hypoechoic and nodular.

Gastrointestinal

Examination of the **gastrointestinal tract** revealed a stomach and intestine free of stasis, of normal wall thickness, acceptable curvilinear mural detail, and peristaltic activity. Small and large intestine

PATIENT

Ally Jung

SPECIES

Pancreas

Canine

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

BREED

Beagle

SEX

Spayed female

ULTRASONOGRAPHIC FINDINGS

Diffuse hepatic neoplasia.

Enlarged, irregular left adrenal gland.

AGE

14 years

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

WEIGHT

33.6 lbs

Humane euthanasia should be considered in this patient given the extent of the metastatic type pathology.
