

## PATIENT

Zoey Schreger

## SPECIES

Feline

## BREED

Domestic Shorthair

## SEX

Spayed female

## AGE

12 years

## WEIGHT

6.3 lbs

## INTERPRETED BY

Eric Lindquist, DMV,  
DABVP (CFM), Cert.  
IVUSS, CEO of  
SonoPath.com

## IMAGING PERFORMED BY

Chloe Lowe

## HOSPITAL NAME

Hamburg VC

## REFERRING VET

Dr. DenHeyer

## INVOICE

71859

## DATE

2/24/26

## PRESENTING CLINICAL SIGNS

- Anorexic. On chemo, history of lymphoma
- ondansetron, Cerenia
- Abnormal PE/Chem/CBC/UA Results: NSF

## ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

### *Urinary System*

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The pelvic urethra was imaged 2.0 cm beyond the cystourethral junction and appeared normal. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes was noted. Ureteral papillae were normal.

The **kidneys** revealed largely normal size and structure, corticomedullary definition and ratio (cortex 1/3 of medulla) were essentially maintained with some age-related loss of curvilinear patterns regarding the capsule and C/M junction. The cortices presented largely uniform texture with some increased echogenicity expected for this age patient. Medullary structure differed distinctly from that of the cortex and no evidence of pelvic dilation was present. The left kidney measured 3.2 cm. The right kidney measured 3.5 cm.

### *Adrenal Glands*

Both **adrenal glands** were visualized and recognized as having normal shape, size, position and echogenicity for this breed. The phrenic vasculature, glandular echogenicity and detail were unremarkable. Capsule, cortex, and medullary definition were normal for this age patient. The left adrenal gland measured 0.27 cm and the right adrenal gland measured 0.4 cm.

### *Spleen*

The **spleen** in this patient was uniform, yet volume contracted. Hydration status should be assessed.

### *Liver*

The **liver** images from right and left intercostal as well as subcostal views revealed subjectively normal liver size, contour, and structure. Some age-related parenchymal remodeling was noted but likely not clinically significant at this time. Vascular and biliary tracts were of normal volume and no evidence of congestion was noted. The gallbladder presented some dependent debris with essentially normal contour. The cystic and common bile ducts were normal. No overt evidence of active inflammatory, infiltrative or regenerative pathology was noted but should be paired with current or past LE elevations regarding any clinical significance to this presentation. The hepatic lymph nodes were unremarkable.

**PATIENT**

Zoey Schreger

**SPECIES**

Feline

**BREED**

Domestic Shorthair

**SEX**

Spayed female

**AGE**

12 years

**WEIGHT**

**DATE**

2/24/26

**Gastrointestinal**

The **stomach** revealed a minor amount of ingesta. The luminal material is consistent with hairball. The small intestines and colon were unremarkable with normal curvilinear mural patterns and content.

**Pancreas**

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

**ULTRASONOGRAPHIC FINDINGS**

Hairball density in the stomach, non-obstructive.

Age related abdominal changes, no evidence of specific pathology.

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

Hairball therapy is recommended. The cause of anorexia is unclear, other causes of anorexia such as orthopedic pain, thoracic or CNS disease should all be considered.
