

## PATIENT

Luna Chaturzedi

## SPECIES

Canine

## BREED

Hound Mix

## SEX

Spayed female

## AGE

1 year

## WEIGHT

43 lbs

## INTERPRETED BY

Eric Lindquist, DMV,  
DABVP (CFM), Cert.  
IVUSS, CEO of  
SonoPath.com

## IMAGING PERFORMED BY

Vincent Ravancho,  
CVT

## HOSPITAL NAME

Willowbrook AC

## REFERRING VET

Dr. Bott Wentworth

## INVOICE

74739

## DATE

4/23/26

## PRESENTING CLINICAL SIGNS

History: Dehydration, functional ileus, vomitted Sunday night into Monday AM, Monday night into Tuesday AM. Hx vomiting sporadically for past month. Nauseous past two days per O. Current Medications Prilosec - 20mg BID, Cerenia 60 mg, ondansetron 16mg BID  
Abnormal PE/Chem/CBC/UA Results: Rad report 4/21 - Three views of the abdomen are available for review. The abdominal serosal detail is reduced. The stomach is moderately distended with fluid and gas. On right lateral projection there is a small amount of mineral debris within the pyloric antrum which is gas filled on left lateral projection. The small intestines are a single population mostly soft tissue opaque/fluid filled. The colon contains heterogeneous soft tissue opaque fecal material with single mineral opaque focus (admixed foreign debris and incidental).

## ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

### *Urinary System*

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes was noted. Ureteral papillae were normal.

The **kidneys** revealed normal size and structure, corticomedullary definition and ratio for this age. The cortices presented largely uniform texture with normal echogenic relationship to liver and spleen. Medullary structure differed distinctly from the cortex and no evidence of pelvic dilation was present. The capsules were acceptably uniform without significant irregularities. The left kidney measured 6.14 cm. The right kidney measured 6.22 cm.

### *Adrenal Glands*

Both **adrenal glands** were visualized and recognized as having normal shape, size, position and echogenicity for this breed. The phrenic vasculature, glandular echogenicity and detail were unremarkable. Capsule, cortex, and medullary definition were normal for this age patient. The right adrenal gland measured 2.03 x 1.02 cm at the cranial pole and 0.53 cm at the caudal pole. The left adrenal gland measured 3.18 x 0.68 cm at the cranial pole and 0.55 cm at the caudal pole.

### *Spleen*

The **spleen** presented a smooth homogeneous parenchyma hyperechoic to liver and renal cortical parenchyma. The capsule was smooth without noticeable expansion or deviation from within the spleen or adjacent pathology. The splenic vasculature demonstrated normal volume without signs of congestion or thrombosis. No sonographic evidence of acute or chronic inflammatory, neoplastic, or infarctual changes was noted.

**PATIENT**

Luna Chaturzedi

**SPECIES**

Canine

**BREED**

Hound Mix

**SEX**

Spayed female

**Liver**

The **liver** images submitted revealed subjectively normal liver size, contour, and structure. Parenchymal echogenicity was naturally coarse and hypoechoic to the spleen. Vascular and biliary tracts were of normal volume with no evidence of congestion. The gallbladder presented acceptably thin walls with primarily anechoic content. The cystic and common bile ducts were normal. No pathological hepatic lymphadenopathy was evident. No overt structural evidence of inflammatory, infiltrative or regenerative pathology was evident.

**Gastrointestinal**

Examination of the **gastrointestinal tract** revealed a stomach and intestine free of stasis, of normal wall thickness, acceptable curvilinear mural detail, and peristaltic activity. Small and large intestine demonstrated normal luminal chyme and stool consistency respectively. No obstructive or overt infiltrative disease was noted. No associated abnormal lymphatic activity was noted.

**Pancreas**

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

**ULTRASONOGRAPHIC FINDINGS**

Structurally normal abdomen.

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

There was no evidence of foreign bodies or obstruction. There was no evidence of visceral disease. Medical management should prove effective.

Dietary indiscretion, food intolerance, structurally significant inflammatory bowel or occult parasitism and occult Addison's are all potentials.
