PRESENTING CLINICAL SIGNS

- Chronic GI symptoms and fevers. Dehydrated. GI blood loss
- IV fluid therapy, cerenia, cefazalon
- Leukocytes and neutrophilia Low MCV/MCH

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The **urinary bladder** was mildly thickened with a minimal amount of urine present. The pelvic urethra was imaged 2.0 cm beyond the cystourethral junction and appeared normal.

The **kidneys** revealed normal size and structure, corticomedullary definition and ratio for this age. The cortices presented largely uniform texture with normal echogenic relationship to liver and spleen. Medullary structure differed distinctly from the cortex and no evidence of pelvic dilation was present. The capsules were acceptably uniform without significant irregularities. The right kidney measured 5.6 cm. The left kidney measured 5.13 cm.

Adrenal Glands

The left **adrenal gland** was uniform. The right adrenal gland was slightly heterogenous. The left adrenal gland measured 2.03 x 0.63 cm at the cranial pole and 0.58 cm at the caudal pole. The right adrenal gland measured 2.09 x 0.84 cm at the cranial pole and 0.62 cm at the caudal pole.

Spleen

The **spleen** in this patient was mildly enlarged with uniform parenchyma and was folded upon itself cranially. This is a positional variant and is not pathological. There was no evidence of significant disease.

Liver

The **liver** revealed mildly increased portal markings with uniform parenchyma. The hepatic vascularity was normal. The gallbladder and common bile duct were unremarkable.

Gastrointestinal

The **gastric** wall was mildly thickened without loss of mural detail. Some mucosal remodeling was noted as well as excessive GI gas. The gastric wall measured 1.3 cm. The majority of the small intestine was unremarkable. Normal stool consistency was noted in the colon. The mesenteric lymph nodes were reactive.

Pancreas

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

ULTRASONOGRAPHIC FINDINGS

Mild, chronic GI changes.

Slightly heterogenous right adrenal gland.

Increased portal markings.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Urinalysis work-up is recommended given the minor bladder thickening. If hypertension is present then urine metanephrine level is indicated. Enterotoxins, parasitic disease, chronic inflammatory bowel is all possible. There is no overt neoplastic criteria noted in any of the organs.
