Neutered male

AGE

11 years

ULTRASONOGRAPHIC EXAMINATION OF THE HEART

The echocardiogram in this patient demonstrated normal **left atrial** size based on 3 separate LA measurements. **Mitral** valve insufficiency was noted. The anterior mitral valve leaflet was mildly thickened. Minor remodeling and sectorial hypertrophy was noted in the **left ventricle**. The **myocardium** presented normal echogenicity without subjective evidence of significant fibrotic or ischemic disease. **Contractility** of the ventricular walls was adequate and in normal range for this patient evidenced by the fractional shortening measurement and subjective evaluation of the different regions and angles of the myocardium. The **left ventricular outflow** tract demonstrated normal laminar flow and subjective structural integrity. The **right atrium** and auricle revealed normal size, structure and content. No evidence of masses was noted or chamber overload. **Tricuspid** valvular assessment demonstrated adequate linear morphology and kinetics. The **right ventricle** was of normal size (1/3 diameter of LV), chordae structure, myocardial echogenicity and thickness. **Pulmonic** tract assessment revealed normal valve structure, laminar flow, and diameter (approx. 1:1 pa/ao ratio). No visible **pericardial** or free pleura fluid was noted or extra cardiac pathology in the visible planes. The cranial **mediastinum and pericardial regions** were free of masses in the visible window.

PATIENT

ULTRASONOGRAPHIC FINDINGS

Cream Barash Hocking

Minor left ventricular hypertrophy, sectorial hypertrophy and mitral insufficiency, compensated.

SPECIES

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Feline

Consistent with HCM phenotype.
