PRESENTING CLINICAL SIGNS

History: Patient presents for petechiae/ecchymosis, suspect IMT, want to rule out neoplasia. Current meds (started yesterday): Doxycycline 200mgs BID, Pred. 20 mgs BID, famotadine 10 mgs BID, Proviabie SID.

Abnormal PE/Chem/CBC/UA Results: As of 11/15/22: Glob. 3.9, PLTs 11, M. hemocanis/hematoparvum (+).

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes was noted. Ureteral papillae were normal.

The **kidneys** revealed normal size and structure, corticomedullary definition and ratio for this age. The cortices presented largely uniform texture with normal echogenic relationship to liver and spleen. Medullary structure differed distinctly from the cortex and no evidence of pelvic dilation was present. The capsules were acceptably uniform without significant irregularities. The right kidney measured 6.0 cm. The left kidney measured 5.7 cm.

Adrenal Glands

Both **adrenal glands** were visualized and recognized as having normal shape, size, position and echogenicity for this breed. The phrenic vasculature, glandular echogenicity and detail were unremarkable. Capsule, cortex, and medullary definition were normal for this age patient. The right adrenal gland measured 2.46 x 0.89 cm at the cranial pole and 0.65 cm at the caudal pole. The left adrenal gland measured 2.17 x 0.63 cm at the caudal pole and 0.63 cm at the cranial pole.

Spleen

The **spleen** was slightly enlarged, yet uniform with no evidence of thrombosis.

Liver

The **liver** revealed slight coarse architecture with mildly increased portal markings. The gallbladder and common bile duct were unremarkable.

Gastrointestinal

Examination of the **gastrointestinal tract** revealed a stomach and intestine free of stasis, of normal wall thickness, acceptable curvilinear mural detail, and peristaltic activity. Small and large intestine demonstrated normal luminal chyme and stool consistency respectively. No obstructive or overt infiltrative disease was noted. No associated abnormal lymphatic activity was noted.

PATIENT

Pancreas

Oda McBride

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

SPECIES

Canine

ULTRASONOGRAPHIC FINDINGS

BREED

Mix

Minor hepatic remodeling.

Otherwise, unremarkable abdomen.

SEX

Spayed female

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

There was no evidence of primary disease associated with the clinical history; however, given the cortisone treatment I cannot rule out suppressed underlying round cell neoplasia. However, there was no structural evidence of disease noted.
