

PATIENT	PRESENTING CLINICAL SIGNS
Lucy Keegan	Lethargic, shaking.
SPECIES	ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN
Canine	<i>Urinary System</i>
BREED	The urinary bladder , trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes was noted. Ureteral papillae were normal.
Mix	
SEX	
Spayed female	The kidneys revealed normal size and structure, corticomedullary definition and ratio for this age. The cortices presented largely uniform texture with normal echogenic relationship to liver and spleen. Medullary structure differed distinctly from the cortex and no evidence of pelvic dilation was present. The capsules were acceptably uniform without significant irregularities. Both kidneys measured 7.56 cm.
AGE	
11 years	
INTERPRETED BY	<i>Adrenal Glands</i>
Eric Lindquist, DMV DABVP, Cert. IVUSS	The adrenal glands appeared subjectively flattened. The left adrenal gland measured 2.53 x 0.4 cm. The right adrenal gland measured 2.19 x 1.23 cm at the cranial pole and 0.5 cm at the caudal pole.
IMAGING PERFORMED BY	<i>Spleen</i>
Eric Lindquist, DMV DABVP, Cert. IVUSS	The spleen in this patient was mildly enlarged with uniform parenchyma and was folded upon itself cranially. This is a positional variant and is not pathological. There was no evidence of significant disease.
HOSPITAL NAME	<i>Liver</i>
Rockaway AH	The liver images submitted revealed subjectively normal liver size, contour, and structure. Parenchymal echogenicity was naturally coarse and hypoechoic to the spleen. Vascular and biliary tracts were of normal volume with no evidence of congestion. The gallbladder presented acceptably thin walls with primarily anechoic content. The cystic and common bile ducts were normal. No pathological hepatic lymphadenopathy was evident. No overt structural evidence of inflammatory, infiltrative or regenerative pathology was evident.
REFERRING VET	<i>Gastrointestinal</i>
Dr. Maniar	Examination of the gastrointestinal tract revealed a stomach and intestine free of stasis, of normal wall thickness, acceptable curvilinear mural detail, and peristaltic activity. Small and large intestine demonstrated normal luminal chyme and stool consistency respectively. No obstructive or overt infiltrative disease was noted. No associated abnormal lymphatic activity was noted.

PATIENT

Pancreas

Lucy Keegan

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

SPECIES

Canine

ULTRASONOGRAPHIC FINDINGS

BREED

Mix

Subjectively flattened adrenal glands.

Otherwise, unremarkable abdomen.

SEX

Spayed female

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

ACTH stimulation or baseline cortisol is indicated.

AGE

11 years
