

PATIENT

Monster Ferguson

PRESENTING CLINICAL SIGNS

History: Patient with history of splenectomy presents for intermittent vomiting and strange odor from mouth. History of mast cell disease.

SPECIES

Canine

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

BREED

Pitbull Terrier

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes was noted. Ureteral papillae were normal.

SEX

Neutered male

The residual prostate was slightly enlarged and measured 0.26 cm with urethral mineralization.

AGE

7 years

The **kidneys** revealed normal size and structure, corticomedullary definition and ratio for this age. The cortices presented largely uniform texture with normal echogenic relationship to liver and spleen. Medullary structure differed distinctly from the cortex and no evidence of pelvic dilation was present. The capsules were acceptably uniform without significant irregularities. The right kidney measured 8.06 cm. An anechoic cyst was noted in the caudal pole of the left kidney.

WEIGHT

108 lbs

Adrenal Glands

Both **adrenal glands** were visualized and recognized as having normal shape, size, position and echogenicity for this breed. The phrenic vasculature, glandular echogenicity and detail were unremarkable. Capsule, cortex, and medullary definition were normal for this age patient. The right adrenal gland measured 2.15 x 1.14 cm at the cranial pole and 0.62 cm at the caudal pole. The left adrenal gland measured 2.44 x 0.72 cm at the caudal pole and 0.47 cm at the cranial pole.

INTERPRETED BY

Eric Lindquist, DMV,

CEO of SonoPath.com

IMAGING PERFORMED BY

Kelly Vazquez, CVT

Spleen

The **spleen** was not imaged as it was previously removed.

HOSPITAL NAME

Rockaway AH

Liver

The **liver** images submitted revealed subjectively normal liver size, contour, and structure. Parenchymal echogenicity was naturally coarse and hypoechoic to the spleen. Vascular and biliary tracts were of normal volume with no evidence of congestion. The gallbladder presented acceptably thin walls with primarily anechoic content. The cystic and common bile ducts were normal. No pathological hepatic lymphadenopathy was evident. No overt structural evidence of inflammatory, infiltrative or regenerative pathology was evident.

REFERRING VET

Dr. Maniar

INVOICE

32643

Gastrointestinal

The **stomach** revealed soft shadowing material such as grass or similar. This is non-obstructive, yet may be irritative and measured approximately 4.0 cm. The small intestines and colon were unremarkable.

DATE

8/30/22

PATIENT

Pancreas

Monster Ferguson

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

SPECIES

Canine

ULTRASONOGRAPHIC FINDINGS

BREED

Pitbull Terrier

Soft shadowing gastric material.

SEX

Neutered male

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

If the patient was truly n.p.o. at the time of the sonogram then I would be concerned for soft foreign matter. 24 hour n.p.o. and a recheck sonogram of the pyloric outflow is recommended.
