PRESENTING CLINICAL SIGNS

History: not eating, moaning, stretching, uncomfortable, on and off vomiting for about 2 weeks
Abnormal PE/Chem/CBC/UA Results: cortisol normal, prev bw wnl not febrile.

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes was noted. Ureteral papillae were normal.

The **kidneys** revealed normal size and structure, corticomedullary definition and ratio for this age. The cortices presented largely uniform texture with normal echogenic relationship to liver and spleen. Medullary structure differed distinctly from the cortex, and no evidence of pelvic dilation was present. The capsules were acceptably uniform without significant irregularities. The left kidney measured 6.3 cm. The right kidney measured 6.4 cm.

Adrenal Glands

The **left adrenal gland** was visualized and recognized as having normal shape, size, position and echogenicity for this breed. The phrenic vasculature, glandular echogenicity and detail were unremarkable. Capsule, cortex, and medullary definition were normal for this age patient. The left adrenal gland measured 0.5 cm.

The **right adrenal gland** was not visualized.

Spleen

The **spleen** in this patient was uniform, yet volume contracted. Hydration status should be assessed.

Liver

The **liver** images submitted revealed subjectively normal liver size, contour, and structure. Parenchymal echogenicity was naturally coarse and hypoechoic to the spleen. Vascular and biliary tracts were of normal volume with no evidence of congestion. The gallbladder presented acceptably thin walls with primarily anechoic content. The cystic and common bile ducts were normal. No pathological hepatic lymphadenopathy was evident. No overt structural evidence of inflammatory, infiltrative or regenerative pathology was evident.

Gastrointestinal

The **stomach** was overdistended with fluid and chyme (aperistalsic). The pylorus was patent yet filled with ingesta and chyme. The small intestine was empty. Enhanced mesentery was noted, consistent with adhesions and peritonitis. Dilated upper gastrointestinal tract was noted, followed by empty small intestine, creating an obstructive pattern. The caudal abdomen revealed an obstructive dilation of the small intestine, suspect fabric foreign body, measuring approximately 4.0 cm. Variable areas of intestinal thickening were noted. The colon was unremarkable.

Pancreas

DATE

11/29/25

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

Free Abdomen

A large amount of echogenic **free fluid** was noted in the abdomen.

ULTRASONOGRAPHIC FINDINGS

- Obstructive intestinal pattern with peritonitis and portions of unhealthy bowel
- Volume contracted spleen

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Recommend immediate exploratory surgery in this patient. This is a surgical emergency.
