PRESENTING CLINICAL SIGNS

- vomited few time today
- losing weight
- drooling a lot
- smell bad from his mouth even if he has no gum infection or dental disease

Abnormal PE/Chem/CBC/UA Results: CBC/CHEM unremarkable

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The bladder is moderately distended with a moderate amount of suspended echogenic debris consistent with either pyuria or crystalluria. No uroliths are seen. The bladder wall is normal in appearance and thickness. No masses are seen.

The left kidney presents normal size with normal shape and architecture. Normal corticomedullary distinction. No pyelectasia, ureteral dilation or nephrolithiasis. The left kidney measured 3.5 cm in length.

The right kidney presents normal size with normal shape and architecture. Normal corticomedullary distinction. No pyelectasia, ureteral dilation or nephrolithiasis. The right kidney measured 3.1 cm in length.

Adrenal Glands

The left and right adrenal glands are not clearly seen on this exam.

Spleen

The spleen is normal in size, shape, margination and echogenicity. No masses are seen.

Liver

The liver presents normal size and shape with smooth lobar margins. The parenchyma has normal echogenicity with normal echotexture. No focal lesions are seen. Intrahepatic bile ducts are normal. Normal vascular pattern.

The gallbladder presents normal size with anechoic contents. Normal gallbladder wall. No evidence of bile duct distention or obstruction.

Gastrointestinal

The stomach is moderately fluid filled with mixed hyperechoic debris consistent with what appears to be partially digested food. Overall, the gastric wall appears to have normal wall layering and thickness and measures approximately 1.6 mm in width. The jejunum appears diffusely normal measuring 2.0 mm in width with normal layering. Colon contains normal contents with normal wall thickness.

The pancreas is diffusely mildly hypoechoic with a uniform echotexture. There is no surrounding hyperechoic fat.

Free Abdomen

There are no enlarged abdominal lymph nodes seen on this exam. No free abdominal fluid is seen.

ULTRASONOGRAPHIC FINDINGS

- urinary bladder debris consistent with either pyuria or crystalluria.
- Fluid filled stomach with hyperechoic contents consistent with ingesta- inflammatory bowel disease or possibly small cell lymphoma or mast cell disease with infectious disease thought less likely.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Recommend urinalysis if not already performed and if active urine sediment, urine culture and antibiotic sensitivity.

It appears that the patient has functional gastritis with no evidence of a mechanical obstruction seen within the stomach. Gastric disease would explain the patient's clinical signs of vomiting and halitosis. Recommend treating the patient supportively for gastritis using anti-nausea such as Cerenia at 1.0 mg/kg by mouth once a day and include a pro-kinetic such as Erythromycin at 0.5 to 1.0 mg/kg given by mouth every 8 hours.

If patient fails to improve with supportive care, then recommend either surgical or endoscopic gastric and intestinal biopsies to determine etiology of gastric disease.
