PRESENTING CLINICAL SIGNS

- Clinical Exam Findings: Diarrhea issues intermittently. Positive Diarrhea PCR Panel for corona virus

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The bladder is moderately distended with a marked amount of suspended echogenic debris. No uroliths are seen. The bladder wall is normal in appearance and thickness. No masses are seen. The debris is possible due to pyuria from urinary tract infection or possible due to marked crystalluria.

The left kidney presents normal size with normal shape and architecture. Normal corticomedullary distinction. No pyelectasia, ureteral dilation or nephrolithiasis. The left kidney measured 4.1 cm in length.

The right kidney presents normal size with normal shape and architecture. Normal corticomedullary distinction. No pyelectasia, ureteral dilation or nephrolithiasis. The right kidney measured 4.2 cm in length.

Adrenal Glands

The left adrenal gland presents normal shape and homogenous parenchyma. The phrenic vasculature is unremarkable. The left adrenal gland measured 3.3 mm in width.

The right adrenal gland presents normal shape and homogenous parenchyma. The phrenic vasculature is unremarkable. The right adrenal gland measured 4.4 mm in width.

Spleen

The spleen is at the upper end of normal in size, shape, margination and echogenicity. No masses are seen. The spleen measured 9.4 mm in width.

Liver

The liver presents normal size and shape with smooth lobar margins. The parenchyma has normal echogenicity with normal echotexture. No focal lesions are seen. Intrahepatic bile ducts are normal. Normal vascular pattern.

The gallbladder presents normal size with anechoic contents. Normal gallbladder wall. No evidence of bile duct distention or obstruction.

Gastrointestinal

The stomach and intestines have normal wall layering and thickness. Colon contains normal contents with normal wall thickness. The stomach contains a mild amount of retained ingesta. No pyloric outflow tract obstruction is seen. The patient appears to potentially not be completely fasted for the exam.

Pancreas

The visible left/right limb of the pancreas is normal in size with normal echogenic parenchyma and surrounded by normal peri-pancreatic mesentery.

Free Abdomen

There are no enlarged abdominal lymph nodes seen on this exam. No free abdominal fluid is seen.

ULTRASONOGRAPHIC FINDINGS

- Urinary bladder debris.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Recommend urinalysis and urine culture if active urine sediment. No cause for patient's intermittent diarrhea seen on this exam. If the fecal panel performed did not test for tritrichomonas, recommend submitting for tritrichomonas as possible cause of diarrhea.

Recommend dietary trial of a hydrolyzed diet. If patient fails a diet trial, consider Tylosin trial. Recommend 30 mg/kg of Tylosin mixed into the food twice per day.

If parasitism is definitively ruled out, patient fails diet trial and antibiotic trial, then consider GI biopsies either surgically or endoscopically. Recommend endoscopically as it is minimally invasive.

Diagnosis at this time appears fair to good pending results of recommended diagnostics.
